May 2013–Revised November 2013

WARNING: EXPORT NOTICE

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from Disclosing party under this Agreement, or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorisation from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws. This provision shall survive termination or expiration of this Agreement.

According to our best knowledge of the state and end-use of this product or technology, and in compliance with the export control regulations of dual-use goods in force in the origin and exporting countries, this technology is classified as follows:

US ECCN: 3E991

EU ECCN: EAR99

And may require export or re-export license for shipping it in compliance with the applicable regulations of certain countries.

About This Manual

FCC Warning

This equipment is intended for use in a laboratory test environment only. It generates, uses, and can radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to subpart J of part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment in other environments may cause interference with radio communications, in which case the user at his own expense will be required to take whatever measures may be required to correct this interference.

Information About Cautions and Warnings

This book may contain cautions and warnings.

CAUTION

This is an example of a caution statement.

A caution statement describes a situation that could potentially damage your software or equipment.

WARNING

This is an example of a warning statement.

A warning statement describes a situation that could potentially cause harm to you.

The information in a caution or a warning is provided for your protection. Please read each caution and warning carefully.

Register, Field, and Bit Calls

The naming convention applied for a call consists of:

- For a register call: *<Module name>.<Register name>*; for example: UART.UASR
- For a bit field call:
  - *<Module name>.<Register name>[End:Start] <Field name> field*; for example, UART.UASR[4:0] SPEED bit field
  - *<Field name> field <Module name>.<Register name>[End:Start]*; for example, SPEED bit field UART.UASR[4:0]
- For a bit call:
  - *<Module name>.<Register name>[pos] <Bit name> bit*; for example, UART.UASR[5] BIT_BY_CHAR bit
  - *<Bit name> bit <Module name>.<Register name>[pos]*; for example, BIT_BY_CHAR bit UART.UASR[5]

To help the reader navigate the document, each register call is hyperlinked to its register description in the register manual section. After each register description, a table summarizes all hyperlinked register calls.

To navigate in the PDF documents, see Acrobat Reader Tips.

Coding Rules

The programming models or code listings follow the rules:

Type	Definition	Example
File	Starts with the module name	PRCM_test1.c MCBSP1_init.h
Variable	Global variables are prefixed by "g_" Pointers are prefixed by "p" Global pointers are prefixed by "g_p"	g_SDMA_LogicalChan pAddrCounter g_pSDMA_LogicalChan
Function	Starts with the module name	PRCM_SetupClocks() ArmIntC_MaskInterrupts()
Typedef	Ends with "_t"	PRCM_Struct_t
Definition	Starts with the module name and is followed by the register name	#define SMS_ERR_TYPE *((volatileUint32*)0x680080F4) #define MCBSP2_RCR1_REG *((volatile Uint32*)0x4807401C)
Enumeration	Starts with the module name	Typedef enum DMA_Mode_Label { INPUT_MODE OUTPUT_MODE } DMA_Mode_t;

Flow Chart Rules

Flow charts follow the following rules:

Shape	Name	Definition
	Process	Any computational steps or processing function of a program; defined operation(s) causing change in value, form, or location of information
	Decision	A decision or switching-type operation that determines which of a number of alternate paths is followed
	Predefined process or sub-process	One or more named operations or program steps specified in a subroutine or another set of flow charts
	Data or I/O	General I/O function; information available for processing (input) or recording of processed information (output)
	Terminator	Terminal point in a flow chart: start, stop, halt, delay, or interrupt; may show exit from a closed subroutine
	Annotation	Additional descriptive clarification, comment
	On page connector (reference)	Exit to, or entry from, another part of chart in the same page
	Off page connector (reference)	The flow continues on a different page.
	Summing Junction	Logical AND
	Or	Logical OR
	Parallel mode (ISO)	Beginning or end of two or more simultaneous operations
	Flow Line	Lines indicate the sequence of steps and the direction of flow.

Acrobat Reader Tips

Acrobat includes two methods to search for words in a PDF:

- The Find toolbar provides a basic set of options to locate a word in the current PDF.
- The Search window lista words or partial words that match your text in the current PDF.

These guidelines apply to Acrobat Reader 5.x, 6.0, and 7.0.

For more information on Acrobat Reader search features, see the Adobe Reader Help.

To search for words in a document using the Find dialog box:

1. Open the document.
2. To display the Find toolbar, right-click in the toolbar area and select Find.
3. In the Find box, type the word, words, or partial words for which you want to search.
4. From the Find Options menu, select options as desired.
5. To view each search result, click the Find toolbar, the Find Previous button, or the Find Next button to go backward or forward through the document.

To search for words in a document using the Search PDF window:

1. Open the document.
2. Click the Search button on the File toolbar or right-click on your document and select Search.
3. Type the word, words, or part of a word for which you want to search.
4. Click Search.
5. The results appear in page order and, if applicable, show a few words of context. Each result displays an icon to identify the type of occurrence. All other searchable areas display the Search Result icon.
6. To display the page that contains a search result, click an item in the Results list. The occurrence is highlighted.
7. To navigate to the next result, choose Edit > Search Results > Next Result (or Ctrl+G).
8. To navigate to the previous result, choose Edit > Search Results > Previous Result (or Shift+Ctrl+G).

Navigate through your previous view

To retrace your path within an Adobe PDF document:

- For the previous view: Choose View > Go To > Previous View or Alt+Left Arrow.
- For the next view: Choose View > Go To > Next View or Alt+Right Arrow. The Next View command is available only if you have chosen Previous View.

  If you view the PDF document in a browser, use options on the Navigation toolbar to move between views.

  - Right-click the toolbar area, and then choose *Navigation*.
  - Click the Go To Previous View button or the Go To Next View button.

NOTE: This navigation tip is useful to return to your previous view after clicking on a register call hyperlink.

History

The following table summarizes the OMAP543x ES2.0 TRM versions.

Version	Literature Number	Date	Notes
V	SWPU249	May 2013	See (1)
W	SWPU249	July 2013	See (2)
X	SWPU249	July 2013	See (3)
Y	SWPU249	November 2013	See (4)

(1) Public version of *OMAP543x Multimedia Device Silicon Revision 2.0 Technical Reference Manual*, version V (SWPU249V) — initial release to the public domain.

(2) Public version of *OMAP543x Multimedia Device Silicon Revision 2.0 Technical Reference Manual*, version W (SWPU249W)
Chapters impacted by update to version W:
- Chapter 1: Introduction
- Chapter 3: Power Reset and Clock Management
- Chapter 19: Control Module

(3) Public version of *OMAP543x Multimedia Device Silicon Revision 2.0 Technical Reference Manual*, version X (SWPU249X)
Chapters impacted by update to version X:
- Preface
- Chapter 10: Display Subsystem

(4) Public version of *OMAP543x Multimedia Device Silicon Revision 2.0 Technical Reference Manual*, version Y (SWPU249Y)
Chapters impacted by update to version Y:
- Chapter 16: Memory Subsystem
- Chapter 24: Serial Communication Interfaces
- Chapter 29: Initialization

Introduction

This chapter introduces the features, subsystems, and architecture of the OMAP543x high-performance multimedia device.

Topic **Page**

1.1 Overview

The OMAP543x high-performance multimedia application device is based on enhanced OMAP™ architecture and uses 28-nm technology.

- The architecture is designed to provide best-in-class CPU performance, video, image, and graphics processing for a broad range of multimedia-rich applications. The device supports the following functions:
  - Streaming video up to full high definition (Full-HD) (1920 × 1080p, 60 fps)
  - Stereoscopic video recording and playback up to Full-HD (1920 × 1080p, 30 fps)
  - 2-dimensional (2D)/3-dimensional (3D) gaming and video contents
  - Video conferencing
  - High-resolution still image (up to 24 MP)
  - Full-HD video capture and encode (1920 × 1080 resolution)
  - Efficient support for web browsing
- The device supports high-level operating systems (OS) such as:
  - Android™
  - Linux®

  and others.
- The device is composed of the following major subsystems:
  - Cortex™-A15 microprocessor unit (MPU) subsystem, including two ARM® Cortex-A15 cores
  - Digital signal processor (DSP) subsystem
  - Image and video accelerator high-definition (IVA-HD) subsystem
  - Cortex™-M4 image processing unit (IPU) subsystem, including two ARM Cortex-M4 microprocessors
  - Display subsystem
  - Audio back-end (ABE) subsystem
  - Imaging subsystem (ISS), consisting of image signal processor (ISP) and still image coprocessor (SIMCOP) block
  - 3D-graphics accelerator subsystem, including POWERVR™ SGX544 dual-core
  - Debug subsystem
- The device includes state-of-the-art power management techniques required for high-performance mobile products.
- Comprehensive power management is integrated into the device.
- The device also integrates:
  - On-chip memory
  - External memory interfaces
  - Memory management
  - Level 3 (L3) and level 4 (L4) interconnects
  - System and connecting peripherals

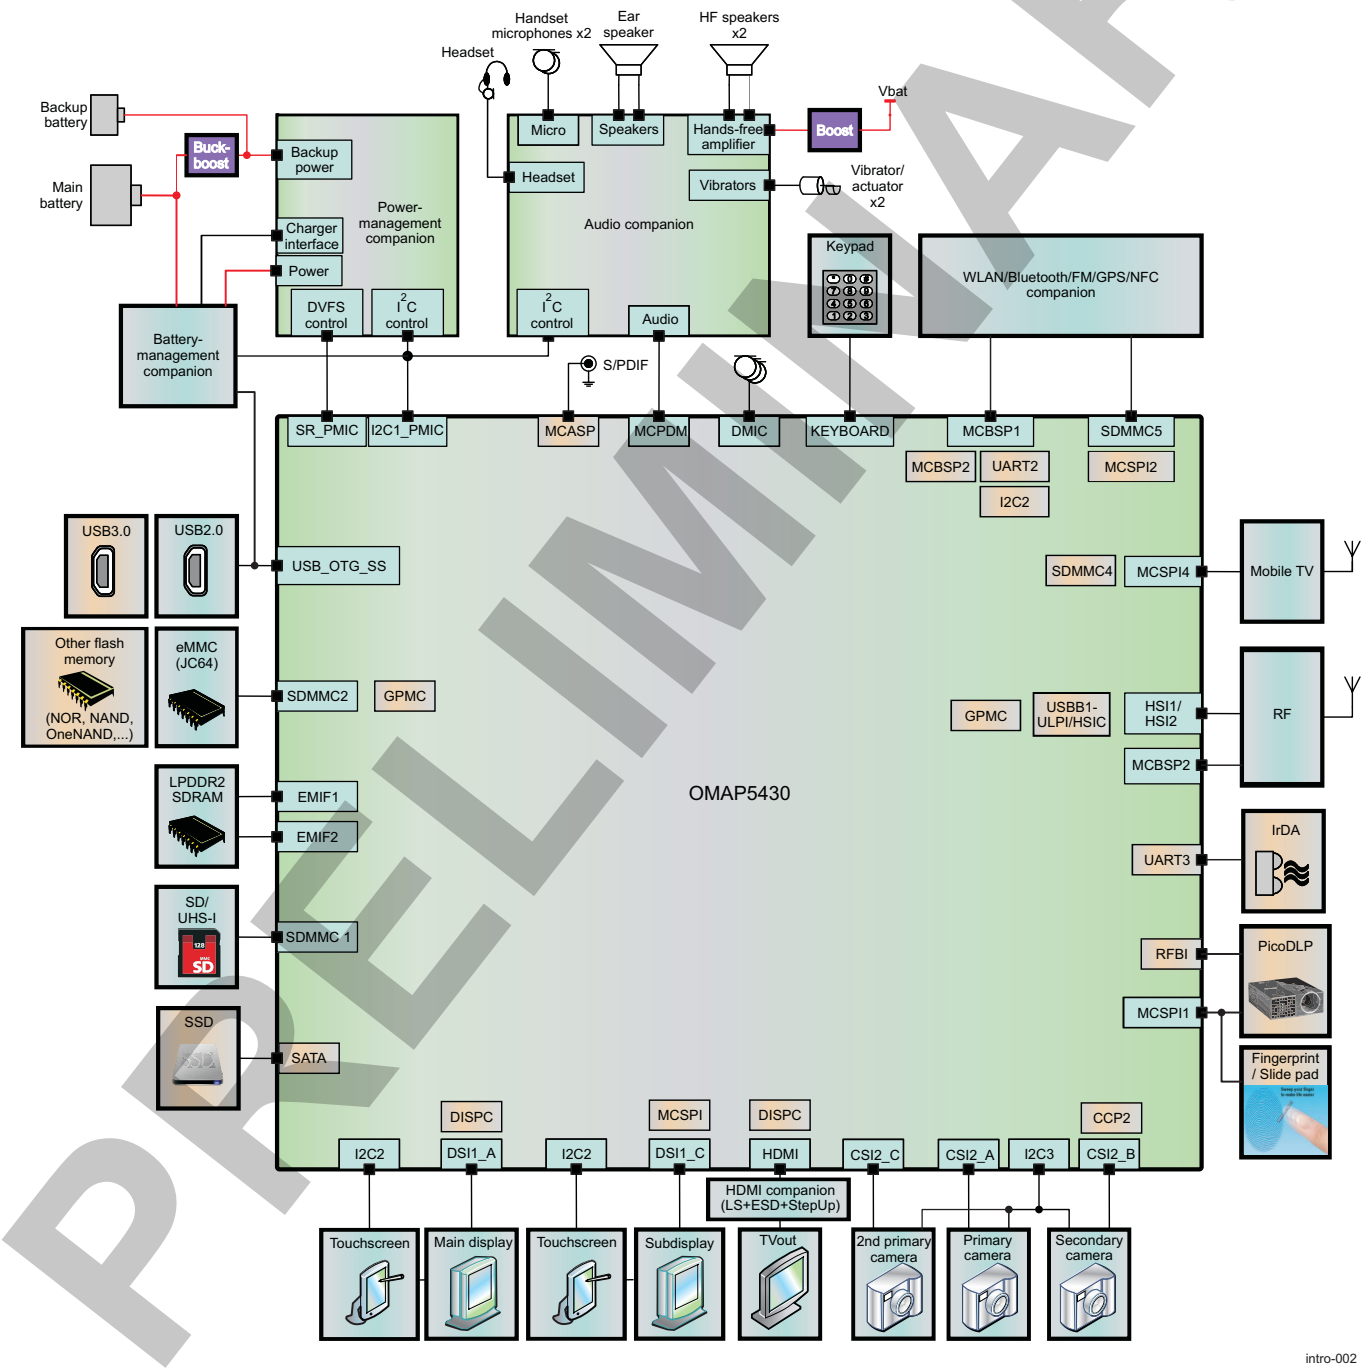
1.2 OMAP5430 Environment

This section provides an overview of the OMAP5430 high-tier environment. See more information about the OMAP5432 device in Appendix A, *OMAP5432 Multimedia Device*.

The device is associated with power-management companion and audio companion integrated circuits (ICs). TI provides a global solution with the TWL6035/TWL6037 power-management- and TWL6041 audio-companion devices.

Figure 1-1 is an overview of a nonexhaustive environment for the high-tier OMAP5430 device.

Figure 1-1. OMAP5430 High-Tier Environment



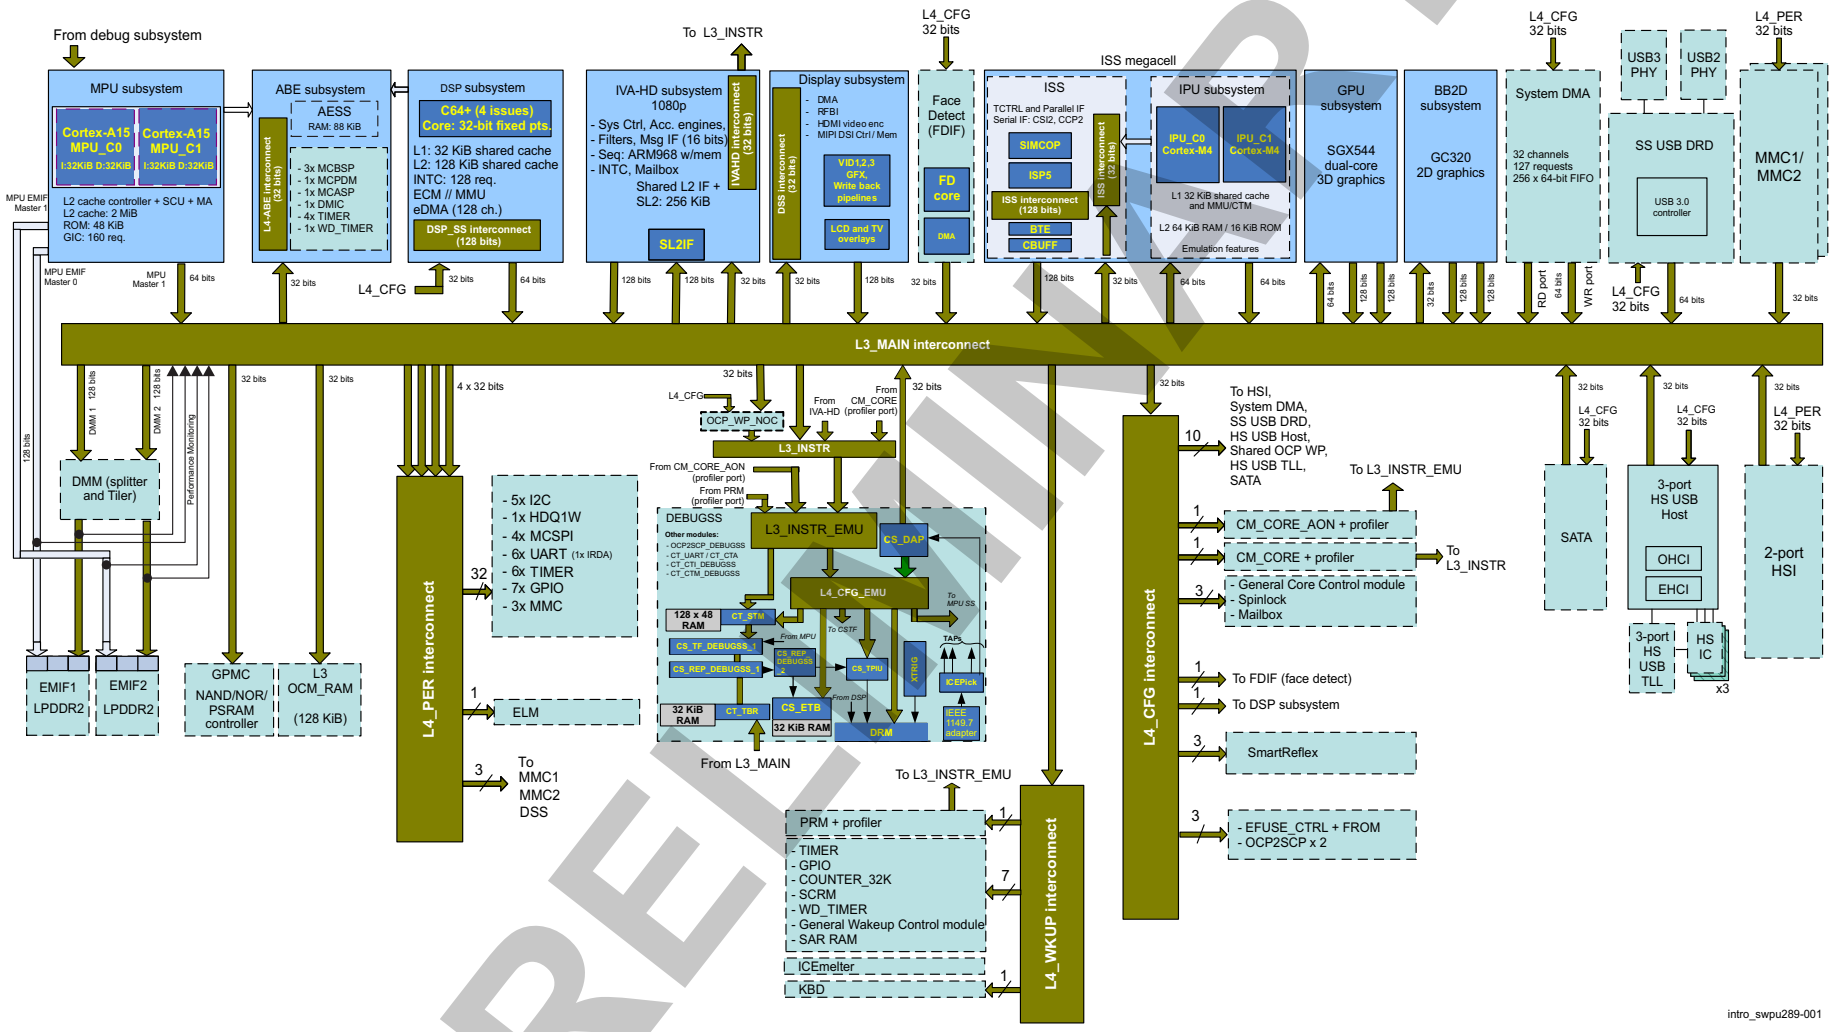
1.3 OMAP5430 Description

The subsystems described in the current subsection apply to the OMAP5430 high-tier device. For more information about the OMAP5432 device see Appendix A, *OMAP5432 Multimedia Device.*

The OMAP5430 device is offered in a 980-ball, 14 × 14 -mm, 0.4-mm bottom ball pitch package. Some balls (240 balls, 0.5-mm pitch) are available at the top of the device to allow LPDDR2 memory stacking.

Figure 1-2 is the block diagram of the OMAP5430 device.

Figure 1-2. OMAP5430 Block Diagram



1.3.1 MPU Subsystem Description

The Cortex-A15 MPU subsystem integrates the following submodules:

- ARM Cortex-A15 MPCore
  - Two central processing units (CPUs)
  - ARM Version 7 ISA: Standard ARM instruction set plus Thumb®-2, Jazelle® RCT Java™ accelerator, hardware virtualization support, and large physical address extensions (LPAE)
  - Neon™ SIMD coprocessor and VFPv4 per CPU
  - Interrupt controller with up to 160 interrupt requests
  - One general-purpose timer and one watchdog timer per CPU
  - Debug and trace features
  - 32-KiB instruction and 32-KiB data level 1 (L1) caches per CPU
- Shared 2-MiB level 2 (L2) cache
- 48-KiB bootable ROM
- Local power, reset, and clock management (PRCM) module
- Emulation features
- Digital phase-locked loop (DPLL)

1.3.2 DSP Subsystem Description

The DSP subsystem contains the following submodules:

- TMS320DM64™ 32-bit fixed DSP core for audio processing and general-purpose imaging and video processing. It is backward compatible with existing C64x™ video codecs.
  - 32-KiB L1 4-way set associative cache
  - 128-KiB L2 8-way set associative cache
- Enhanced direct memory access (DMA_DSP) engine with 128 channels for video/audio data transfer between IVA3 local memories and external SDRAM memories or peripherals
- Interrupt controller (INTC) with up to 128 interrupt requests
- Memory management unit (MMU) for address management. It translates virtual addresses handled by the DSP CPU into physical addresses.
- DPLL

The DSP subsystem allows direct access to the ABE subsystem, and has emulation capabilities.

1.3.3 IVA-HD Subsystem Description

The IVA-HD subsystem is a set of video encoder/decoder hardware accelerators that supports:

- Real-time video encoding and decoding
- MPEG4/H264 up to 1920 × 1080p @ 60 fps
- MPEG2 decoding up to 1920 × 1080p @ 60 fps
- Supporting JPEG encode/decode up to 96 MP/s

The IVA-HD subsystem is composed of:

- Improved motion estimation acceleration engine (IME3), which is used in encoding processing
- Improved loop filter acceleration engine (ILF3), which performs deblocking filtering
- Improved sequencer (ICONT1) based on the ARM968E-S™ microcontroller. It includes memory and INTC and is used as a primary sequencer.
- Intraprediction estimation engine (IPE3). It is used in encoding processing.
- Calculation engine (CALC3), which performs transform and quantization calculations
- Motion compensation engine (MC3), which creates an interprediction macroblock with given motion vectors and modes from the reference data
- Entropy coder/decoder (ECD3), which uses Huffman and arithmetic codes during the process of

encoding and decoding the stream

- Video DMA processor (ICONT2), which is also based on the ARM968E-S microcontroller and can be used as secondary sequencer
- Video DMA engine (vDMA), which is a DMA engine for data transmission between external memories and shared L2 memory
- Synchronization box (SYNCBOX) embedded in each hardware accelerator and in both ICONTs
- Mailbox for communication between IVA-HD and external to it processors (DSP, MPU, and IPU)
- Shared L2 interface and memory
- Video local interconnect for connection between the submodules of the IVA-HD
- IVA-HD system control module (SYSCTRL), which controls the clocks in the subsystem and PRCM handshaking

The IVA-HD subsystem can process three data formats for internal data: picture or slice, macroblock header, and residual data.

The IVA-HD supports the following formats:

- MPEG-1/-2/-4 such as MPEG-2 MP, HP, and MPEG-4 as SP/ASP
- DivX 5.02 and above
- Sorenson Spark (decode)
- H.263 P0 (encode and decode) and P3 (decode)
- H.264 Annex G (scalable baseline profile up to 720p)
- H.264 BL/MP/HP
- H.264 Annex H (partial)
- Stereoscopic video
- JPEG (encode/decode)
- VC-1 SP/MP/AP
- AVS-1.0
- RealVideo® 8/9/10 (decode only)
- On2® VP6.2/VP7 (decode only)

1.3.4 Image Processing Unit (IPU) Subsystem

The Cortex-M4 IPU subsystem includes the following components:

- Two Cortex-M4 CPUs
- ARMv7E-M and Thumb-2 instruction set architecture
- Hardware division and single-cycle multiplication acceleration
- Dedicated INTC with up to 63 physical interrupt events with 16-level priority
- Two-level memory subsystem hierarchy
  - L1
    32-KiB shared cache memory
  - L2 ROM + RAM
    - 64-KiB RAM
    - 16-KiB bootable ROM
- Cortex-M4 system bus directly connected to the ISS interconnect
- MMU for address translation
- Integrated power management
- Emulation feature embedded in the Cortex-M4

1.3.5 Display Subsystem

The display subsystem provides the control signals required to interface the OMAP system memory frame buffer (SDRAM) directly to the displays. It supports hardware cursor, independent gamma curve on all interfaces, multiple-buffer, and programmable color phase rotation. The display subsystem allows low-power display refresh and arbitration between normal and low-priority pipelines.

The display subsystem consists of the following sections:

- **Display controller:** Reads and displays the encoded pixel data stored in memory and writes the output of one of the overlays or one of the pipelines into the system memory. The display controller supports the following components:
  - Three video pipelines, one graphic pipeline, and one write-back pipeline. The graphic pipeline supports pixel formats such as: ARGB16-4444, RGB16-565, ARGB16-1555, ARGB32-8888, RGBA32-8888, RGB24-888, and BITMAP (1, 2, 4, or 8 bits per pixel). It allows selection of the color-depth expansion.
  - Write-back pipeline: Uses poly-phase filtering for independent horizontal and vertical resampling (upsampling and downsampling). It allows programmable color space conversion of RGB24 into YUV4:2:2-UYVY, YUV4:2:2-YUV2, or YUV4:2:0-NV12 or NV21, and selection of color-depth reduction from RGB24 to RGB16.
  - Three LCD outputs, each one with dedicated overlay manager, for support of active matrix color displays (up to 24-bit interface).
  - One TV output with dedicated overlay manager to support HDMI video port
  - All outputs (three LCDs and one TV), besides other interfaces, are available through the parallel CMOS interface for MIPI®-DPI 2.0 support.
  - Own direct memory access (DMA) engine
- **Remote frame buffer interface (RFBI) module:**
  - Support for MIPI-DBI protocol
  - 8-/9-/12-/16-bit parallel interface
  - Programmable pixel modes and output formats
- **Two MIPI display serial interfaces (DSI)** with the following main features:
  - Support for MIPI-DSI v01.01.00 (four data-lane complex I/Os)
  - Support for video mode and command mode
  - Data interleaving support for synchronous and asynchronous streams
  - Bidirectional data link support
- **High-definition multimedia interface (HDMI) encoder** with the following main features:
  - HDMI 1.4a, HDCP 1.4, and DVI 1.0 compliant

    Includes support for the 3D stereoscopic frame-packing formats of HDMI v1.4a standard (720p, 50 Hz; 720p, 60 Hz; 1080p, 30 Hz; and side-by-side half structure: 1080p, 60 Hz)
  - Deep-color mode support (10 bit for up to 1080p and up to 12 bit for 1080i/720p)
  - Expanded support for color spaces (xvYCC601, xvYCC709, sYCC601, AdobeYCC601, and AdobeRGB)
  - Support for uncompressed multichannel audio
  - Integrated high-bandwidth digital content protection (HDCP) encryption engine for transmitting protected audio and video content
  - Integrated transition minimized differential signaling (TMDS) and TERC4 encoders for data island support

1.3.6 ABE Subsystem

The ABE subsystem handles audio processing for the application. It manages the audio and voice streams between the MPU subsystem and/or DSP, and the physical interfaces.

The ABE subsystem allows:

- Buffering of audio samples
- Mixing audio with voice downstream and/or microphone upstream (sidetone)
- Postprocessing of equalization, 3D effects, bass-boost

The ABE subsystem consists of:

- Audio engine (AE) subsystem, which performs real-time signal processing such as:
  - Muxing and mixing voice and data streams
  - Postprocessing operations such as sampling rate conversion, volume control, smooth muting, side tone equalization, 3D effects, bass-boost
  - Execution of whole data transfers in the ABE subsystem using audio traffic controller (ATC)

    The AE subsystem includes an AE and has the following on-chip memories available: 64-KiB data memory (DMEM); 6-KiB coefficient memory (CMEM); and 18-KiB sample memory (SMEM).

    The ATC manages the data movement in the ABE subsystem and is in charge of interrupt generation to the DSP and MPU subsystems.
- Four general-purpose timers and one watchdog timer
- Peripheral interfaces:
  - Three multichannel buffered serial ports (MCBSP) for inter-IC sound (I^2S™) external connectivity
  - One multichannel audio serial port (MCASP) supporting Sony/Philips digital interconnect format (S/PDIF) output, and four-channel I^2S in either direction
  - One digital microphone controller (DMIC) for three stereo digital microphones support
  - One multichannel pulse-density modulation (MCPDM) interface, which ensures communication with the TWL6041 audio companion chip
- Internal interfaces for connection with the DSP and MPU subsystems and other modules in the device

1.3.7 Imaging Subsystem (ISS)

The ISS processes data coming from the image sensor, memory, and IVA-HD subsystem. The ISS is responsible for multimedia applications such as: camera viewfinder; video record with up to 1080p at 60 fps or stereoscopic record up to 1080p at 30 fps with digital zoom, video stabilization, rotation and auto-convergence. The ISS supports a pixel throughput of up to 304 MP/s. It assures good performance with sensors up to 24 MP and more (higher resolution can be achieved using vertical frame division mode). ISS supports still image capture during video record. The ISS can implement third-party algorithms for further flexibility when working with image sensors.

The ISS consists of:

- The ISP, which deals with on-the-fly or memory-to-memory data processing. It allows data collection for autoexposure, autowhite balance, autofocus, resizing, and histogram generation. The ISP consists of:
  - Image pipe interface (IPIPEIF) for synchronization signals (HD, VD) for the ISIF, IPIPE, RSZ, and hardware 3A (H3A) modules, and data transfer from video port, SDRAM, ISIF. Various pixel data manipulation functions.
  - Image pipe (IPIPE) front-end and back-end modules for raw data processing and RGB and YUV data processing, respectively. They support:
    - Sensor data linearization for dynamic range extension
    - Programmable 2D lens shading compensation correction
    - Black-level compensation
    - Defect pixel correction (LUT_DPC) with look-up table
    - Defect pixel correction (OTF_DPC) with on-the-fly detection and correction
    - Green imbalance correction (GIC)
    - Gamma correction
    - RGB color correction
    - RGB to YUV4:2:2 color conversion

    - 3D look up table (LUT) for color correction
    - 2D noise filtering
    - 2D edge enhancement
    - False chroma suppression
  - H3A for autowhite balance, autoexposure, and autofocus
  - Two independent resizers, which allow YUV4:2:2 to YUV4:2:0 planar chroma filtering and downsampling. The resizers support input and output flows with up to 304 MP/s, and memory-to-memory rescaling in the range ×1/4096 scale down, and ×20 scale up. RGB565, ARGB888, YUV422 co sited and YUV4:2:0 planar (NV12 or NV21) data output.
  - Image sensor interface (ISIF) can process the incoming data and supports the following main functions:
    - Sensor data linearization
    - Supports VGA read out mode
    - Color space conversion
    - Digital clamp with horizontal/vertical offset drift compensation
    - Vertical line defect correction
    - Programmable 2D-matrix lens shading correction
    - 10-to-8 bits A-Law compression table inside
  - Buffer logic (BL), which processes and manages the requests to the module and memory subsystem
- Peripheral serial interfaces for connection with sensors and memories:
  - One MIPI CSI-2 compliant with four RX data lanes
  - One MIPI CSI-2 compliant with two RX data lanes
  - One MIPI CSI-2 compliant with one RX data lane / MIPI CSI-1 / CCP2
- Peripheral 16-bit parallel interface, BT656 and SYNC mode
- SIMCOP coprocessor for memory-to-memory operation; JPEG encode/decode hardware acceleration; high-ISO filtering; block-based rotation; warping and fusion; and general-purpose imaging acceleration. The SIMCOP includes the following main submodules:
  - Two imaging extension (iMX) modules – programmable image and video processing engines
  - Noise filter 2 (NSF2) – for advanced noise filtering and edge-enhancement
  - Noise filter 3 (NSF3) – next generation NSF for advanced noise filtering and edge-enhancement, supporting Bayer RGB format
  - Variable-length coder/decoder for JPEG (VLCDJ) module
  - Discrete cosine transform (DCT) module
  - Warping accelerator for lens distortion correction (LDC) and chromatic aberration correction
  - Rotation accelerator (ROT) engine
  - Hardware sequencer, which offloads sequencing tasks from the MPU
  - Shared buffers/memories
  - DMA controller
- Timing control module for CAM global reset control, CAM flash strobe, and CAM shutter
- Bayer scaler module allowing low latency still image capture and stabilization statistics collection.

1.3.8 3D Graphics Processing Unit (GPU)

The 3D graphics processing unit subsystem is based on POWERVR® SGX544 subsystem from Imagination Technologies. It supports phone/PDA and handheld gaming applications. The GPU can process different data types simultaneously, such as: pixel data, vertex data, video data, and general-purpose data processing.

The GPU subsystem has the following features:

- Multicore GPU architecture: two SGX544 cores. Shared system level cache of 128 KiB
- Tile-based deferred rendering architecture
- Second-generation universal scalable shader engines (USSE2), multithreaded engines incorporating pixel and vertex shader functionality
- Present and texture load accelerators
  - Enables to move, rotate, twiddle and scale texture surfaces.
  - Supports RGB, ARGB, YUV422 and YUV420 surface formats
  - Supports bilinear upscale
  - Supports source colorkey
- Industry-standard API supports DirectX® 9, OpenGL®-ES 1.1 and 2.0, OpenVG™ 1.1, and OpenCL™1.1 Embedded Profile
- Fine-grained task switching, load balancing, and power management
- Programmable high-quality image antialiasing
- Bilinear, trilinear, anisotropic texture filtering
- Advanced geometry DMA driven operation for minimum CPU interaction
- Fully virtualized memory addressing for OS operation in a unified memory architecture (MMU)

1.3.9 2D Graphics Accelerator

The 2D graphics accelerator (BB2D) subsystem is based on the GC320 2D core from Vivante® Corporation and has the following features:

- API support:
  - OpenWF™, DirectFB
  - GDI/DirectDraw
  - Adobe® Flash®
- BB2D architecture:
  - BitBlt and StretchBlt
  - DirectFB hardware acceleration
  - ROP2, ROP3, ROP4 full alpha blending and transparency
  - Clipping rectangle support
  - Alpha blending includes Java 2 Porter-Duff compositing rules
  - 90-, 180-, 270-degree rotation on every primitive
  - YUV-to-RGB color space conversion
  - Programmable display format conversion with 14 source and 7 destination formats
  - High-quality 9-tap, 32-phase filter for image and video scaling at 1080p
  - Monochrome expansion for text rendering
  - 32 K × 32 K coordinate system

1.3.10 Face Detect Module

The face detect module is a stand-alone module that performs face detection and tracking on a picture stored in the SDRAM memory. It communicates with the MPU, DSP, and IPU subsystems.

Face detect is typically assists:

- Video encoding
- Face-based priority auto-focusing
- Red-eye removal

The face detect module comprises:

- Face detection core with embedded DMA engine for data memory access

- RAM and ROM memories
- L3 and L4 port interfaces

1.3.11 On-Chip Debug Support

The on-chip debug support has the following features:

- Multiprocessor debugging lets users control multiple CPU cores embedded in the device, such as:
  - Global starting and stopping of individual or multiple processors
  - Each processor can generate triggers that can be used to alter the execution flow of other processors
  - System clocking and power down
  - Interconnection of multiple devices
  - Channel triggering
- Target debugging, using IEEE1149.1 (JTAG®), or IEEE1149.7 (complementary superset of JTAG) port
- Reduction of power consumption in normal operating mode
- Real-time software trace allows the OMAP software masters to transmit trace data from OS processes or tasks on 256 different channels.

The debug subsystem includes:

- IEEE1149.7 adapter
- Generic TAP for emulation and test control (ICEPick-D™)
- Debug access port (DAP)
- Processor trace subsystem
- System trace subsystem
- EMU configuration interconnect
- Cross-triggering unit (XTRIGGER)
- Debug resource manager (DRM)

ICEMelter:

Controls the wake-up and power-down of the emulation power domain

CORE instrumentation (L3_INSTR) interconnect:

- Initiator ports:
  - L3 interconnect (for software instrumentation and performance probes)
  - OCP-WP
  - IVA-HD instrumentation (HWA profiling)
  - CM2 instrumentation
- Target port:
  - EMU instrumentation (L3_INSTR_EMU) interconnect

OCP watch-point (OCP-WP):

- Monitors L3 interconnect transaction when target transaction attributes match the user-defined attributes or trigger on external debug event
- Only one instance, shared among the following L3 targets:
  - GPMC
  - L4_PER
  - L4_CFG
  - DMM_P1 (DMM target port 1)
  - DMM_P2 (DMM target port 2)
  - OCMC_RAM

Power management events profiler (PM instrumentation)

Clock management events profiler (CM instrumentation)

Statistics collector (performance probes)

1.3.12 Power, Reset, and Clock Management

The PRCM module allows efficient control of clocks and power according to the required performance, and reduction of power consumption.

The PRCM module is divided into:

- Power and reset management (PRM), based on the SmartReflex™ framework with the following features:
  - Dynamic clock gating
  - Dynamic voltage and frequency scaling (DVFS)
  - Dynamic power switching (DPS)
  - Static leakage management (SLM)
  - Adaptive body bias (ABB)
- Clock management part 1 (CM_CORE_AON) for clock generation, distribution, and management for the MPU, DSP, ABE, and CORE always-on power domains. The clock management allows reduction of dynamic consumption.
- Clock management part 2 (CM_CORE) for clock generation, distribution, and management for other modules.

1.3.13 On-Chip Memory

The on-chip memory is divided into L3 OCM RAM, SAR RAM, and memories in the subsystems (MPU, DSP, IPU, ABE, and IVA-HD).

- The L3 OCM RAM consists of 128 KiB of on-chip SRAM.
-
- The SAR RAM is used by device ROM code to store the software booting configuration: a logical structure that allows the redefinition of the ROM code default settings when booting after a warm reset.

1.3.14 Memory Management

The memory management is performed from:

- sDMA controller with up to 127 requests, 32 prioritizable logical channels, and 256 × 64-bit FIFO dynamically allocable between active channels
- Dynamic memory management (DMM) module, which performs global address translation, address rotation (tiling), and access interleaving between the two EMIF channels.

1.3.15 External Memory Interface Description

- The SDRAM memory controller (EMIF) allows:
  - Connection between the device and LPDDR2- or DDR3-type of memories. Supported memory depends on device and its package; see Section 1.5, *OMAP543x Family and Device Identification.*
  - Dual-port controller for efficient memory access
  - 32-bit data path, two chip-selects per memory port controller
  - Memory density up to 2 GiB supported per chip-select providing a total SDRAM space of 8 GiB addressable by the MPU extended address range.
- The general-purpose memory controller (GPMC) supports connection with:
  - Asynchronous SRAM memories
  - Asynchronous/synchronous NOR flash memories
  - NAND flash memories

  - Pseudo-SRAM devices
- Two HS-MMC/SD initiator controllers:
  - Support JEDEC JESD64 v4.4.1 and SD3.0 physical layer with SDA3.00 standards
  - Each controller includes its DMA controller compliant to ADMA2 (SDA3.00 Part A2 DMA controller)
  - One controller with 8-bit interface for JC64 memories with dual voltage I/Os (1.2/1.8 V). One controller with a 4-bit interface for external card support with embedded dual voltage I/Os (1.8/3V)
- SATA interface for solid-state drive (SSD) or hard-disk drive (HDD) mass storage. Supports one HBA port with SATA-2 generation speed of 3 Gbps.

1.3.16 System and Connection Peripherals

The OMAP device supports a comprehensive set of peripherals to provide flexible and high-speed interfacing and on-chip programming resources.

1.3.16.1 System Peripherals

- Seven general-purpose timers (TIMER)
- One watchdog timer (WD_TIMER)
- One 32-kHz synchronization timer (COUNTER_32K)
- System control module, which contains registers for the following functions:
  - Static device configuration
  - Debug and observability
  - Status
  - Pad configuration
  - I/O configuration
  - eFuse logic
  - Analog function control
  - System boot decoding logic
- System mailbox with eight mailbox message queues
- One SPINLOCK module with 32 hardware semaphores, which can service tasks between the MPU, DSP, and IPU subsystems

1.3.16.2 Connectivity Peripherals

- Five universal asynchronous receiver/transmitter (UART) modules as serial-communication interfaces
- One UART + IrDA SIR up to FIR + TV remote control interface (CIR)
- Six HS I^2C controller modules; five of them are general-purpose modules with rates up to 3.4 Mbps, and the sixth one, in the PRCM module, performs dynamic voltage control and power sequencing with an external power IC.
- HDQ™/1-Wire® – Benchmarq HDQ and Dallas Semiconductor 1-Wire protocols interface
- Three HS MMC/SD/SDIO modules with 4-bit data bus interface
- Eight general-purpose input/output (GPIO) modules with 32 I/Os each
- One keyboard controller, which supports up to 9 × 9 matrix keypads
- Four multichannel serial peripheral interface (MCSPI) modules
- One single-port SuperSpeed universal serial bus (USB) Dual-Role-Device (DRD) module with embedded PHYs, compliant with the USB2.0 (up to 480 Mbps) and USB3.0 (5 Gbps) standard for HS and SS functions
- One high-speed (HS) multiport USB host module, which can be used for interchip connection or with an off-chip transceiver. It is compliant with the USB2.0 standard. The USB host module allows communication with USB peripherals with data rates up to 480 Mbps for high-speed, up to 12 Mbps for full-speed, and up to 1.5 Mbps for low-speed.
- One MIPI high-speed synchronous serial interface (HSI) module with two full-duplex serial

communication interfaces. It is used for communication between the OMAP device and an external device, with data rates up to 192 Mbps for transmission, and up to 225 Mbps for reception. The MIPI HSI supports 32 logical channels on each destination (RX/TX).

1.4 OMAP5430 Package-On-Package Concept

The OMAP5430 die uses flip-chip technology. The OMAP5430 package-on-page (POP) device supports memory stacking using a POP implementation.

The OMAP5430 die provides two LPDDR2 interfaces. Because each interface supports up to two chip-selects (CSs), up to four LPDDR2 memory dies are supported. Those interfaces are available only on device top ball out.

The two stacked memory packages are directly connected to the two LPDDR2 EMIF interfaces of the OMAP5430 die.

Figure 1-3 shows the concept of the POP solution.

Figure 1-3. POP Concept

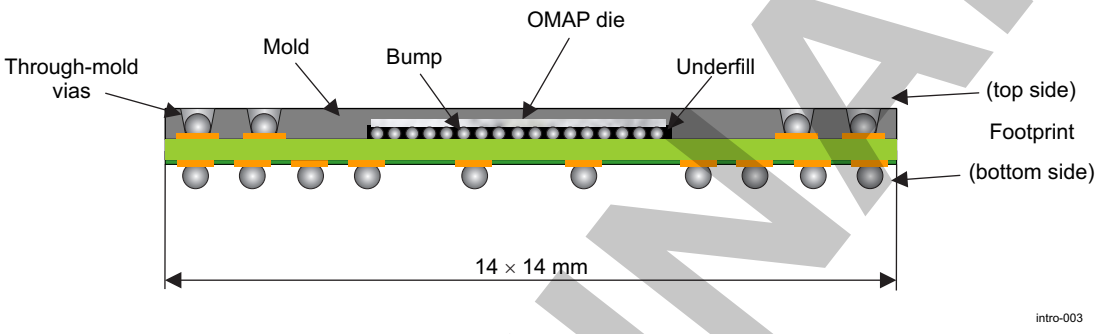


Figure 1-4 shows the stacked memory package on the POP device.

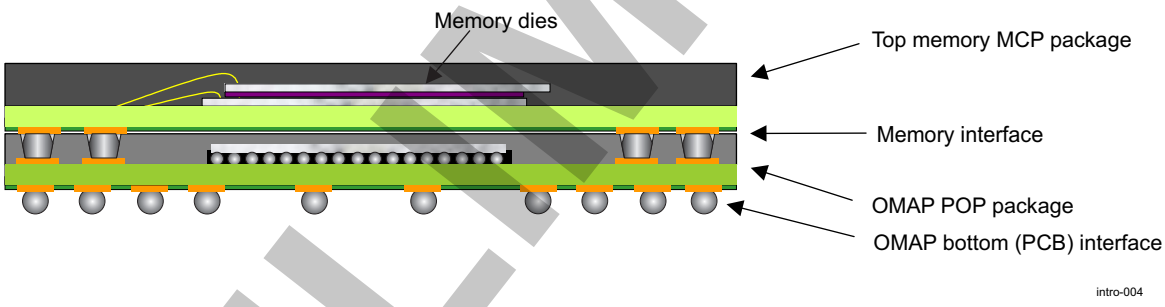
Figure 1-4. Stacked Memory Package on the POP Device



LPDDR2-SDRAM memory is supported in the POP package S4b, with a size of up to 8 GiB and 32-bit data width.

The POP device includes feedthroughs. The feedthroughs are defined from the bottom ball-grid array (BGA) to the stacked memory. The purpose of some of the feedthroughs is to provide power supply to the stacked memories.

1.5 OMAP543x Family and Device Identification

The OMAP543x family is composed of the following devices:

- OMAP5430
- OMAP5432

The OMAP5430 device is offered in a 980-ball, 14 × 14 -mm POP package, which allows LPDDR2 memory stacking. It has all features and functions described in this TRM, except the EMIF DDR3 memory interface.

The OMAP5432 device is offered in a 754-ball, 17 × 17 -mm package, which does not support LPDDR2 memory stacking but instead can interface DDR3 on-board memories. Some of the features and functions described in this TRM are not supported by OMAP5432.

NOTE: See more information about OMAP5432 in Appendix A, OMAP5432 Multimedia Device and the OMAP5432 Data Manual.

Table 1-1 describes the identification registers.

The identification registers include the data registers listed in STD_FUSE_DIE_ID and ID_CODE. These registers are read-only accessed ports that are programmed into eFuses FARM FROM.

Table 1-1. Device Identification Register Fields

Register Field	Alias Name	Physical Address	Address Offset
CONTROL_STATUS[8:6] DEVICE_TYPE	DEVICE_TYPE	0x4A00 2134	0x134
CONTROL_STD_FUSE_DIE_ID_0[31:0] STD_FUSE_DIE_ID_0	DIE_ID[31:0]	0x4A00 2200	0x200

CONTROL_STD_FUSE_PROD_ID[7:0] DEVICE_TYPE	0xF0	Reads 0xF0 when device is a general-purpose (GP) device
CONTROL_STD_FUSE_PROD_ID[31:30] SPEED_GRADE	0x00 or 0x01 0x10	Standard performance (1.5 GHz) High performance (1.7 GHz)

The device type can be read also in the CONTROL_STATUS register.

Table 1-6. DEVICE_TYPE

Register Field	Value	Comment
CONTROL_STATUS[8:6] DEVICE_TYPE	0x3	Reads 0x3 when device is a general-purpose (GP) device

Memory Mapping

This chapter describes the memory mapping.

NOTE: This chapter gives information about all modules and features in the high-tier device. In unavailable modules and features, the memory area is reserved, read is undefined, and write can lead to unpredictable behavior.

For the availability of device modules, see , *OMAP543x Family and Device Identification*, in Chapter 1, *Introduction*, and the corresponding TRM appendix and device data manual.

Topic **Page**

2.1 Introduction

The microprocessor unit (MPU) has a 32-bit address port, which allows it to handle a 4-GiB space divided into several regions, depending on the target type.

The memory map has the following features that are shared among the initiators, such as the MPU subsystem and the image and video accelerator (IVA) subsystem:

- Memory space: General-purpose memory controller (GPMC)
- Dynamic memory management (DMM) controller
- Register spaces: Level 3 (L3) and level 4 (L4) interconnects
- Dedicated spaces: IVA/IPU subsystem, etc.

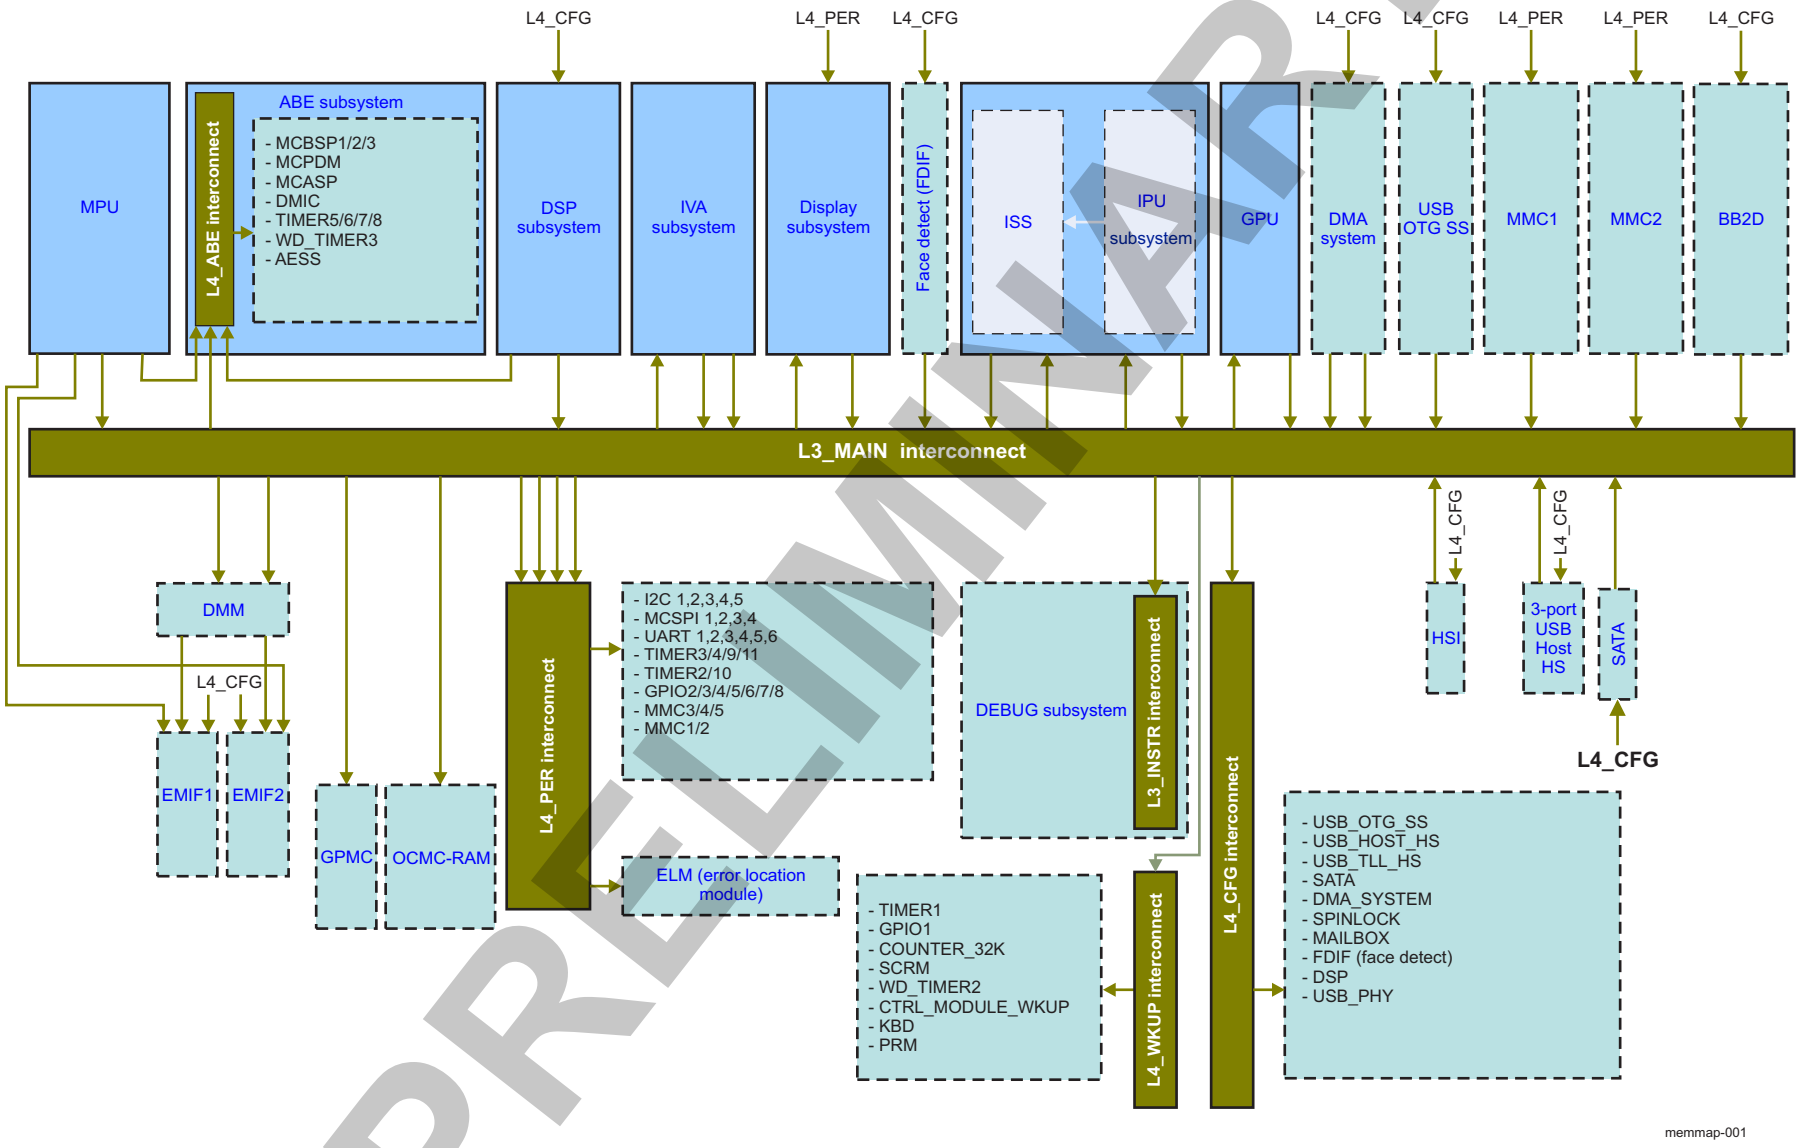
The GPMC and DMM are dedicated to memory connection. The GPMC is used for NOR and NAND flash and static random access memories (SRAMs). The DMM is used for synchronous dynamic random access memories (SDRAMs), such as regular single-data rate (SDR)-SDRAM and mobile double-data rate (DDR)-SDRAM. For more information, see Section 15.2.1, *Dynamic Memory Manager*, and Section 15.3.1, *EMIF Controller*.

The L3 interconnect allows the sharing of resources, such as peripherals and external or on-chip memories, among all the initiators of the platform. The L4 interconnects control access to the peripherals.

Transfers across the platform between initiators and targets are physically conditioned by the chip interconnect and can be logically conditioned by firewalls. For more information about the intercommunication (L3 and L4 interconnects) and protection mechanisms implemented in the device, see Section 14.2.1, *L3 Interconnect*, and Section 14.3.1, *L4 Interconnect*.

Figure 2-1shows the interconnect of the device and the main modules and subsystems in the platform.

Figure 2-1. Interconnect Overview



2.2 L3_MAIN Memory Space Mapping

The memory space system is hierarchical: level 1 (L1), level 2 (L2), L3_MAIN, and L4. L1 and L2 are memories in the MPU, IPU, and digital signal processor (DSP) subsystems. L3_MAIN handles many types of data transfers, including data exchange with system on-chip/external memories. The chip-level interconnect, which consists of one L3_MAIN and four L4s, enables communication among all modules and subsystems.

This section provides a global view of the memory mapping of the device at the L3_MAIN interconnect and describes the boot, GPMC, and SDRAM controller (SDRC) (EMIF/DMM) spaces.

The system memory mapping is flexible, with two levels of granularity for target address space allocation:

- L1: The four quarters are labeled Q0, Q1, Q2, and Q3. Each quarter corresponds to a 1-GiB address space (the total low-address space is 4 GiB, 32-bit). The CPU extended address range is labeled as high memory (Q8 – Q15) and provides a total of 8 GiB.
- L2: Each quarter is divided into eight blocks of 32 MiB, with target spaces mapped in the blocks.

This organization allows the decoding of all target spaces based on the 7 most-significant bits (MSBs) of the 32-bit address ([31:25]).

- Boot space:

  When booting from the on-chip ROM with the appropriate external sys_boot pin configuration, the lowest 1-MiB memory space [0x0000 0000–0x000F FFFF] is redirected to the on-chip boot ROM address space [0x4000 0000–0x400F FFFF].

  When booting from the GPMC, the memory space is part of the GPMC address space. At reset, the 0x0000 0000 address is available on chip-select 0 (CS0) for a memory size of 16 MiB.

  For more information about the sys_boot pins configuration, see Section 15.4.1, *General-Purpose Memory Controller*, and Section 28.1, *Initialization*.
- GPMC space:

  Eight independent GPMC chip-selects (CS0 to CS7) are available in the first quarter (Q0) of the addressing space to access NOR/NAND flash and SRAM. The chip-selects have a programmable start address and programmable size (up to 128 MiB) in a total memory space of (Q0) 1GiB, but limited now to 512 MiB.
- EMIF1/EMIF2 CS0 space:

  Q2 addressing space is interleaved on two LPDDR-memory controllers (EMIF1 and EMIF2), each activating its CS0 line. These chip-selects can be programmed to 64, 128, 256, 512, 1024, and 2048 MiB. Interleaving occurs at 128-byte granularity.

  The EMIF1-CS0 base address is always 0x8000 0000 at reset, and occupies a 1-GiB address space at reset (interleaving is disabled at reset).
- EMIF1 or EMIF2 CS1 space:

  Q3 addressing space is interleaved on two SDRAM controllers (EMIF1 and EMIF2), each activating its CS1 line. These chip-selects can be programmed to 64, 128, 256, 512, and 1024 MiB. Interleaving occurs at 128-byte granularity.

  EMIF1-CS1 and EMIF2-CS1 are disabled at reset. Their base address is programmable to achieve a continuous address space with the respective CS0, regardless of the address range programmed.

  EMIF1-CS1 is disabled if EMIF1-CS0 memory density is set to 2048 MiB (2 GiB) when interleaving is disabled, or if EMIF1-CS0 plus EMIF2-CS0 memory density is set to 1024 MiB (1 GiB) when interleaving is enabled.
- TILER space:

  Q3 addressing space is also used to access the TILER system. This space is visible only for the imaging subsystem (ISS) and the display subsystem.
- 8 GiB of SDRAM virtualization:

  This is a high address range (Q8 – Q15) that requires an address greater than 32 bits.

Table 2-1 describes the global memory space mapping.

Table 2-1. Global Memory Space Mapping

Quarter	Module Name	Start Address (hex)	End Address (hex)	Size	Description

(3) Address range when interleaving is disabled

(4) Address range when interleaving is enabled. Interleaving is configurable with one setting in the MPU memory adapter (MA_MPU) for all 8 GiB of SDRAM high memory. For more information about interleaving, see Section 4.3.4.1, *MA_MPU Functional Description*.

2.2.1 L3_INSTR Memory Space Mapping

The L3_INSTR interconnect is a 2-MiB space composed of the L3_INSTR interconnect configuration registers and module registers.

Table 2-2 describes the mapping of the registers for the L3_INSTR interconnect.

Table 2-2. L3_INSTR Memory Space Mapping

2.3 L4 Memory Space Mapping

Four L4 interconnects handle transfers with peripherals. Each interconnect is in a distinct power domain:

- L4_CFG: CORE power domain
- L4_WKUP: WKUP power domain
- L4_PER: PER power domain
- L4_ABE: ABE power domain

As with the L3_MAIN interconnect, the L4 interconnect can be configured to tune the access according to the characteristics of each module.

The following sections describe the register mapping of the L4 interconnect. Software configures these registers.

2.3.1 L4_CFG Memory Space Mapping

The L4_CFG interconnect is a 16-MiB space composed of the L4_CFG interconnect configuration registers and the module registers.

Table 2-3 describes the mapping of the registers for the L4_CFG interconnect.

NOTE: All memory spaces described as modules provide direct access to module registers outside the L4_CFG interconnect. All other accesses are internal to the L4_CFG interconnect.

2.3.3 L4_PER Memory Space Mapping

The L4_PER interconnect is a 16-MiB memory space composed of the L4_PER interconnect configuration registers and the module registers.

Table 2-5 describes the mapping of the registers for the L4_PER interconnect.

NOTE: All memory spaces described as modules provide direct access to the module registers outside the L4_PER interconnect. All other accesses are internal to the L4_PER interconnect.

2.3.4 L4_ABE Memory Space Mapping

The L4_ABE interconnect is a memory space composed of the L4_ABE interconnect configuration registers and the module registers.

ABE modules are dual-mapped inside the MPU/DSP address space:

- Mapped in L3 as the L4 ABE space
- Mapped in MPU and DSP nonshared device map

NOTE: All memory spaces described as modules provide direct access to the module registers outside the L4_ABE interconnect. All other accesses are internal to the L4_ABE interconnect.

Table 2-6 describes the mapping of the registers for the L4_ABE interconnect in the MPU nonshared (private) device address range (L4_ABE).

Table 2-6. ABE MPU Memory Space Mapping

Module Name	Start Address (hex)	End Address (hex)	Size	Description
L4_ABE	0x4010 0000	0x4010 3FFF	16KiB	ABE domain (direct MPU access)

2.5 DSP Subsystem Memory Space Mapping

The DSP subsystem can access ABE.

ABE has three address spaces:

- ABE NC: This region is for accesses to registers in ABE. For more information about ABE peripheral memory mapping, see Table 2-6.
- ABE: This region is for accesses to memory in ABE. Memory in the ABE subsystem can be cached in DSP L1 and L2. When eDMA tries to access this space, L1/L2 is snooped and if data is present in DSP subsystem caches, data is provided to eDMA from DSP caches. However, if data is not present in DSP caches, the shared cache sends the access to ABE and data returned is not allocated into DSP cache; instead, it is sent to eDMA.
- ABE locked region: This region is similar to the ABE region, except that data from ABE is allocated into Tesla caches and returned to eDMA.

Table 2-10 describes the mapping of the registers of the DSP subsystem.

Table 2-10. DSP Subsystem Memory Space Mapping

2.6 Display Subsystem Memory Space Mapping

The display subsystem integrates a display controller (DISPC), a remote frame buffer interface (RFBI), two MIPI® display serial interfaces (DSI1_A and DSI1_C), and a high-definition multimedia interface (HDMI, digital part) link with its PHY.

The DISPC is connected through an interconnect master port to the L3 interconnect and has its own DMAs to fetch the data from the system memory.

2.6.1 L3 Interconnect View of the Display Memory Space

Table 2-11 lists the memory space mapping in the display subsystem from the perspective of the MPU subsystem through the L3 interconnect.

Power, Reset, and Clock Management

This chapter describes the power, reset, and clock management in the device.

Topic **Page**

3.1 Device Power Management Introduction

Power management (efficient use of the limited battery resources on a mobile device) is one of the most important design aspects of any mobile system. It imposes strong control over limited available power resources to ensure they function for the longest possible length of time.

The device power-management architecture ensures maximum performance and operation time for user satisfaction (audio/video support) while offering versatile power-management techniques for maximum design flexibility, depending on application requirements.

This introduction contains the following information:

- Power-management architecture building blocks for the device
- State-of-the-art power-management techniques supported by the power-management architecture of the device

3.1.1 Device Power-Management Architecture Building Blocks

To provide a versatile architecture that supports multiple power-management techniques, the power-management framework is built with three levels of resource management: clock, power, and voltage.

These management levels are enforced by defining the managed entities or building blocks of the power-management architecture, called the clock, power, and voltage domains.

A domain is a group of modules or subsections of the device that share a common entity (for example, common clock source, common voltage source, or common power switch). The group forming the domain is managed by a policy manager. For example, a clock for a clock domain is managed by a dedicated clock manager within the power, reset, and clock management (PRCM) module. The clock manager considers the joint clocking constraints of all the modules belonging to that clock domain (and, hence, receiving that clock).

NOTE: In the following sections, the term <*module*> is used to represent the device IPs (that is, modules or subsystems), other than the PRCM module, that receive clock, reset, or power signals from the PRCM module.

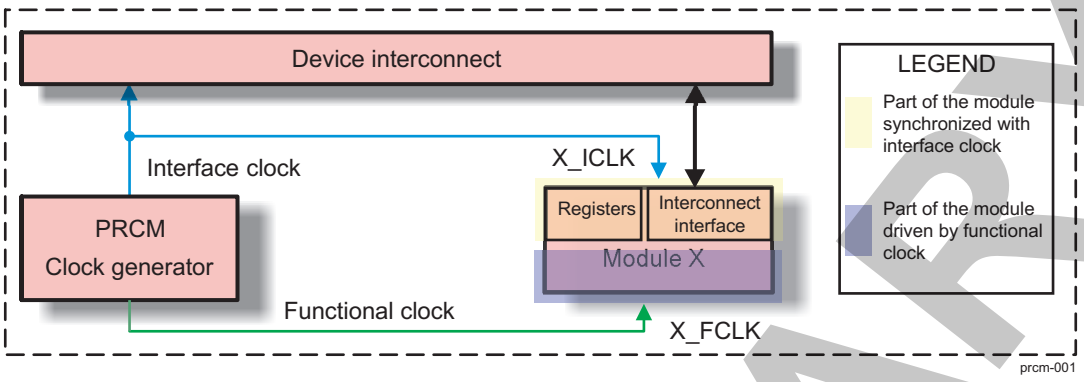
3.1.1.1 Clock Management

The PRCM module manages the gating (that is, switching off) and enabling of the clocks to the device modules. The clocks are managed based on the requirement constraints of the associated modules. The following sections identify the module clock characteristics, management policy, clock domains, and clock domain management.

3.1.1.1.1 Module Interface and Functional Clocks

Each module within the device has specific clock input characteristics requirements. Based on the characteristics of the clocks delivered to the modules, the clocks are divided into two categories: interface clocks and functional clocks (see Figure 3-1).

Figure 3-1. Functional and Interface Clocks



The interface clocks have the following characteristics:

- They ensure proper communication between any module/subsystem and the interconnect.
- In most cases, they supply the system interconnect interface and registers of the module.
- A typical module has one interface clock, but modules with multiple interface clocks may also exist (that is, when connected to multiple interconnect buses).
- Interface clock management is done at the device level.
- From the standpoint of the PRCM module, an interface clock is identified with an _ICLK suffix.

Functional clocks have the following characteristics:

- They supply the functional part of a module or subsystem.
- A module can have one or more functional clocks. Some functional clocks are mandatory, while others are optional. A module needs its mandatory clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the module activity (for example, the clock for the camera).
- From the standpoint of the PRCM module, a functional clock is distributed directly to the related modules through a dedicated clock tree. It is identified with an _FCLK suffix.

Some clocks are qualified as permanent clocks. They are functional clocks, that can stay active while the corresponding entity manages them.

NOTE: At the module level, the interface clocks are always fed by the interface clock outputs of the PRCM module. The functional clocks are fed by a PRCM module functional clock output or a PRCM module interface clock output. In the latter case, the functional and interface module clocks inherit the clock-management features (autoidle features) of the PRCM module interface clock.

3.1.1.1.2 Module-Level Clock Management

Each module in the device may also have specific clock requirements. Certain module clocks must be active when operating in specific modes, or they may be gated. Globally, the activation and gating of the module clocks are managed by the PRCM module. Hence, the PRCM module must be aware of when to activate and when to gate the module clocks.

The PRCM module differentiates the clock-management behavior for device modules based on whether the module can initiate transactions on the device interconnect (called master module) or it cannot initiate transactions and only responds to the transactions initiated by the master (called slave module). Thus, two hardware-based power-management protocols are used:

- Master standby protocol: Clock-management protocol between the PRCM and master modules
- Slave idle protocol: Clock-management protocol between the PRCM and slave modules

Master standby protocol

This protocol is used to indicate that a master module must initiate a transaction on the device interconnect and requests specific (functional and interface) clocks for that purpose. The PRCM module ensures that the required clocks are active when the master module requests the PRCM module to enable them. This is called a module wake-up transition and the module is said to be functional after this transition completes.

Similarly, when the master module no longer requires the clocks, it informs the PRCM module, which can then gate the clocks to the module. The master module is then said to be in standby mode.

Although the protocol is completely hardware-controlled, software must configure the clock-management behavior for the module. This is done by setting the <*Module*>_SYSCONFIG. MIDLEMODE or <*Module*>_SYSCONFIG. STANDBYMODE bit fields, as described in Table 3-1. The behavior, identified in the STANDBYMODE Bit Value column, must be configured.

Table 3-1. Master Module Standby Mode Settings

STANDBYMODE Bit Value	Selected Mode	Description
0x0	Force-standby	The module unconditionally asserts the standby request to the PRCM module, regardless of its internal operations. The PRCM module may gate the functional and interface clocks to the module. This mode must be used carefully because it does not prevent loss of data at the time the clocks are gated.
0x1	No-standby	The module never asserts the standby request to the PRCM module. This mode is safe from a module point of view because it ensures that the clocks remain active; however, it is not efficient from a power-saving perspective because it never allows the PRCM module output clocks to be gated.
0x2	Smart-standby	The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idled. The PRCM module can then gate the clocks to the module.
0x3	Smart-standby wake-up-capable mode	The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idle. The PRCM module can then gate the clocks to the module. The module may generate (master-related) wake-up events when in standby state. The mode is relevant only if the appropriate module mwakeup output is implemented.

NOTE:

- Smart-standby mode is the preferred mode of operation, while force-standby and no-standby modes are intended for debugging purposes.
- A master module may support all or some of the standby modes listed in Table 3-1. See the power-management section in the module chapter to identify the supported standby mode.

The standby status of a master module is indicated by the CM_<*Power domain*>_<*Module*>_CLKCTRL[x]. STBYST bit in the PRCM module. Table 3-2 describes the master module standby status.

Table 3-2. Master Module Standby Status

STBYST Bit Value	Description
0x0	The module is functional.
0x1	The module is in standby mode.

Table 3-3 lists the enabling conditions for the master module clocks managed by the standby protocol.

Table 3-3. Master Module Clock Enabling Conditions

Relation		Condition
AND		Clock domain is ready.
	OR	Master module standby request is deasserted.

Table 3-3. Master Module Clock Enabling Conditions (continued)

Relation		Condition
		Master module wake-up request is asserted.

Slave idle protocol

This hardware protocol allows the PRCM module to control the state of a slave module. The PRCM module informs the slave module, through assertion of an IDLE request, when its clocks (interface and functional) can be gated. The slave can then acknowledge the request from the PRCM module, and the PRCM module is then allowed to gate the clocks to the module. A slave module is said to be in IDLE state when its clocks are gated by the PRCM module.

Similarly, an idled slave module may need to be woken up because of a service request from a master module or because the slave module receives a wake-up event (for example, an interrupt or a direct memory access [DMA] request). In this situation the PRCM module enables the clocks for the module, and then signals the module to wake up by deasserting the IDLE request.

Although the protocol is completely hardware-controlled, software must configure the clock-management behavior for the slave module. This is done by setting the <*Module*>_SYSCONFIG. SIDLEMODE or <*Module*>_SYSCONFIG. IDLEMODE bit field, as described in Table 3-4. The behavior, identified in the IDLEMODE Bit Value column, must be configured by software.

Table 3-4. Module Idle Mode Settings

IDLEMODE Bit Value	Selected Mode	Description
0x0	Force-idle	The module unconditionally acknowledges the IDLE request from the PRCM module, regardless of its internal operations. This mode must be used carefully because it does not prevent loss of data at the time the clock is switched off.
0x1	No-idle	The module never acknowledges any IDLE request from the PRCM module. This mode is safe from a module point of view because it ensures the clocks remain active; however, it is not efficient from a power-saving perspective because it does not allow the PRCM module output clock to be shut off, and thus the power domain to be set to a lower power state.
0x2	Smart-idle	The module acknowledges the IDLE request, basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or DMA requests are processed. This is the best approach to efficient system power management.
0x3	Smart-idle wake-up-capable mode	The module acknowledges the IDLE request, basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or DMA requests are processed. This is the best approach to efficient system power management. The module may generate (IRQ- or DMA-request-related) wake-up events when in IDLE state. The mode is relevant only if the appropriate module swakeup output(s) is implemented.

NOTE:

- Smart-idle mode is the preferred mode of operation, while force-idle and no-idle modes are intended for debugging purposes.
- A slave module may support all or some of the idle modes listed in Table 3-4. See the power-management section in the module chapter to identify the supported idle modes.

The idle status of a slave module is indicated by the CM_<*Power domain*>_<*Module*>_CLKCTRL[x] IDLEST bit field in the PRCM module. Table 3-5 lists the possible idle statuses for a slave module.

Table 3-5. Slave Module Idle Status

IDLEST Bit Value	Idle Status	Description
0x0	Functional	The module is fully functional. The interface and functional clocks are active.
0x1	In transition	The module is performing a wake-up or a sleep transition.

Table 3-5. Slave Module Idle Status (continued)

IDLEST Bit Value	Idle Status	Description
0x2	Interface idle	The module interface clock is idled. The module may remain functional if using a separate functional clock.
0x3	Full idle	The module is fully idle. The interface and functional clocks are gated.

When configured in smart-idle mode, the slave module may acknowledge the IDLE request of the PRCM module based on the activity of its interface and/or functional clocks. To define which module clocks (that is, interface and/or functional) should be considered when responding to the PRCM module request, software must configure the <*Module*>_SYSCONFIG[x] CLOCKACTIVITY bit field.

The CLOCKACTIVITY setting is used internally by the module to determine the part of the module on which the conditions to acknowledge the PRCM module IDLE request are tested. As an example, if the functional clock must remain active when the module is in idle mode, the module must acknowledge a PRCM module IDLE request by considering only the interface clock gating conditions (that is, there is no pending activity on the interconnect).

NOTE: See the power-management section in the module chapter to identify whether this feature is configurable.

Using the CLOCKACTIVITY setting along with smart-idle mode ensures that the clock remains active for the module features that must remain available during the module idle mode. Table 3-6 describes the possible CLOCKACTIVITY settings for a module.

Table 3-6. Slave Module Clock Activity Settings

CLOCKACTIVITY Bit Value	Module Interface Clock	Module Functional Clock	Description
0x0	Gated	Gated	The interface and functional clocks are considered when generating the acknowledgment. This setting also means both clocks may be gated upon a PRCM module IDLE request.
0x1	Active	Gated	The interface clock is not shut down and is not considered when generating the acknowledgment to the PRCM module IDLE request. Only the functional clock is considered.
0x2	Gated	Active	The functional clock is not shut down and is not considered when generating the acknowledgment to the PRCM module IDLE request. Only the interface clock is considered.
0x3	Active	Active	The interface and functional clocks are not shut down. The module can acknowledge the IDLE request without checking the internal functions linked to its clocks.

NOTE:

- The software configuration of the CLOCKACTIVITY settings may not be available for a given module. For some modules, the CLOCKACTIVITY settings can be hardwired.
- A slave module may support all or some of the CLOCKACTIVITY settings listed in Table 3-6.

See the power-management section in the specific module chapter to identify the supported idle feature and settings.

CAUTION

The PRCM module does not have any hardware means to read the CLOCKACTIVITY settings of the module. Software must ensure consistent programming between the CLOCKACTIVITY settings of the module and the clock-gating control bits in the PRCM module. The PRCM module must be configured (where software control is available) not to gate the module clock, which should remain active according to the CLOCKACTIVITY settings of the module.

For idle protocol management on the PRCM module side, the behavior of the PRCM module is configured in the CM_<Power domain>_<module>_CLKCTRL[x] MODULEMODE bit field. Based on the configured behavior, the PRCM module asserts the IDLE request to the module unconditionally (that is, immediately when software requests) or through hardware control when the module idle conditions are satisfied. Table 3-7 describes the configurable behavior of MODULEMODE.

Table 3-7. Slave Module Mode Settings in PRCM

MODULEMODE Bit Value	Selected Mode	Description
0x0	Disabled	The PRCM module unconditionally asserts the module IDLE request. This request applies to the gating of the functional and interface clocks to the module. If acknowledged by the module, the PRCM module can gate all clocks to the module (that is, the module is completely disabled). It can react only to an asynchronous wake-up event (that is, a wake-up event that does not require the module functional clock to be active).
0x1	Auto	This mode applies to a module when the PRCM module manages only its interface clock and not its functional clock. The PRCM module automatically asserts/deasserts the module IDLE request based on the clock domain transitions. If acknowledged by the module, the PRCM module can gate the interface clock to the module.
0x2	Enabled	This mode applies to a module when the PRCM module manages its interface and functional clocks. The functional clock to the module remains active unconditionally, while the PRCM module automatically asserts/deasserts the module IDLE request based on the clock domain transitions. If acknowledged by the module, the PRCM module can gate only the interface clock to the module.
0x3	Reserved	Not available

NOTE: The PRCM module may support all or some of the MODULEMODE module settings listed in Table 3-7. See the CM_<Power domain>_<module>_CLKCTRL[x] MODULEMODE bit field description for the module to identify the supported settings.

NOTE: Modules, which can be configured with DISABLED or AUTO values of ModuleMode, cannot go from IDLE to DISABLED state if ModuleMode is changed from AUTO to DISABLED while module is in IDLE state. To Perform this transition domain has to be put in force wakeup (CM_<Clock domain>_CLKSTCTRL[1:0] CLKTRCTRL = SW_WKUP).

Table 3-8 and Table 3-9 list the enabling conditions for the slave module clocks managed by the idle protocol.

Table 3-8. Slave Module Interface Clock Enabling Conditions

Relation		Condition
AND		Clock domain is ready.
	OR	Slave module idle status is 0x0 (fully functional).
		Slave module idle status is 0x1 (in transition).
		Slave module wake-up request is asserted.

Table 3-9. Slave Module Functional Clock Enabling Conditions

Relation		Condition
AND		Clock domain is ready.
	OR	Slave module idle status is 0x0 (fully functional).
		Slave module idle status is 0x1 (in transition).
		Slave module idle status is 0x2 (interface clock is idled).
		Slave module wake-up request is asserted.

The module clock domain must be ready for the optional clocks to the module, and any associated clock-enable control is asserted.

NOTE: A given clock can be used by more that one module. Clock-enabling conditions are then ORed together (that is, the clock is provided as soon as one of the enabling conditions is true). As a consequence, the clock is disabled only when all related enabling conditions are false.

Module wake-up request

In IDLE state, a slave module may have to wake up to generate an interrupt or a DMA request. This can be the result of an external request (for example, to the input/output [I/O] port of a general-purpose input/output [GPIO] module) or an internally generated event (for example, WD_TIMER time up). The slave module, with wake-up capability, sends a wake-up request to the PRCM module. The PRCM module then activates the module clocks and acknowledges the module wake-up request.

In IDLE state, some slave modules may require functional clock(s) to generate a wake-up event. Such requests are called synchronous wake-up events on the PRCM module side, while the events generated when the functional or interface module clocks are gated are called asynchronous wake-up events.

NOTE: See the power-management section in the module chapter to identify whether its wake-up event is synchronous or asynchronous.

The standby and idle clock-management protocols allow the configuration of the module-level clock-management interaction between the PRCM module and individual modules of the device. However, the PRCM module may not necessarily gate the clock to the module immediately after the module switches to standby or idle mode at the end of this interaction. This is because the same clock can be shared by other modules that are active and need this shared clock to complete their activity. As a result, the PRCM module provides a second level of clock management called the clock-domain level, as explained in Section 3.1.1.1.3, *Clock Domain*.

3.1.1.1.3 Clock Domain

A clock domain is a group of modules fed by clock signals controlled by the same clock manager in the PRCM module (see Figure 3-2). By gating the clocks in a clock domain, the clocks to all the modules belonging to that clock domain can be cut to lower their active power consumption (that is, the device is on and the clocks to the modules are dynamically switched to ACTIVE or INACTIVE [gated] state). Thus, a clock domain allows control of the dynamic power consumption of the device.

The device is partitioned into multiple clock domains and each clock domain is controlled by an associated clock manager within the PRCM module. This allows the PRCM module to activate and gate individually each device clock domain.

Figure 3-2. Generic Clock Domain

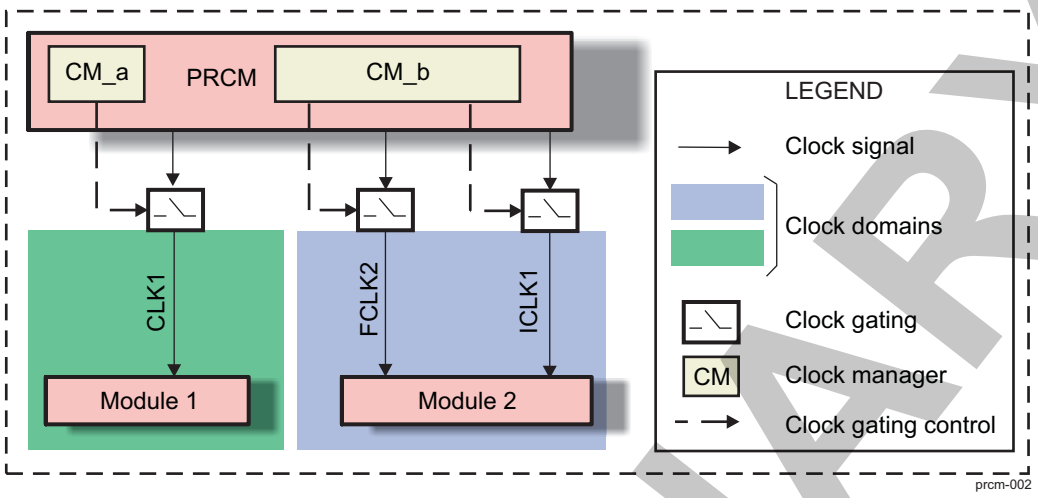


Figure 3-2 is an example of two clock managers: CM_a and CM_b. Each clock manager manages a clock domain. The clock domain of CM_b is composed of two clocks, a functional clock (FCLK2) and an interface clock (ICLK1), while that of CM_a consists of a clock (CLK1) that is used by the module as functional and interface clock. The clocks to Module 2 can be gated independently of the clock to Module 1, thus ensuring power savings when Module 2 is not in use.

The PRCM module lets software check the status of the clock domain functional clocks. The CM_<Clock domain>_CLKSTCTRL[x] CLKACTIVITY_FCLK/<Clock name>_FCLK bit in the PRCM module identifies the state of the functional clock(s) within the clock domain. Table 3-10 lists the two possible states of the functional clock.

Table 3-10. Clock Domain Functional Clock States

CLKACTIVITY Bit Value	Status	Description
0x0	Gated	The functional clock of the clock domain is inactive.
0x1	Active	The functional clock of the clock domain is running.

3.1.1.1.4 Clock Domain-Level Clock Management

The domain clock manager can automatically (that is, based on hardware conditions) and jointly manage the interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings.

A clock domain can switch between three possible states: ACTIVE, IDLE_TRANSITION (IDLEREQ), and INACTIVE (IDLE). Figure 3-3 shows the sleep and wake-up transitions of the clock domain between ACTIVE and INACTIVE states.

Figure 3-3. Clock Domain State Transitions

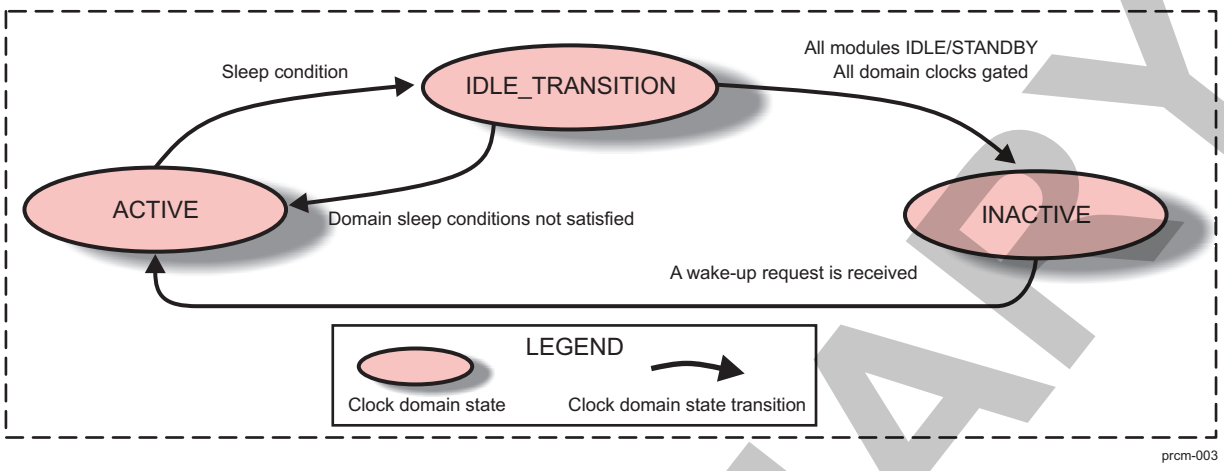

Table 3-11 defines the clock domain states.

Table 3-11. Clock Domain Clock States

State	Description
ACTIVE	• Every nondisabled slave module (that is, those whose MODULEMODE value is not set to disabled) is put out of IDLE state. • All functional clocks to the active slave modules (that is, not idled) of the clock domain are provided. • All interface clocks to the nondisabled slave modules in the clock domain are provided. • All functional and interface clocks to the active master modules (that is, not in STANDBY state) in the clock domain are provided. • Every enabled optional clock to the modules in the clock domain is provided.
IDLE_TRANSITION	This is a transitory state. • Every master module in the clock domain is in STANDBY state. • Every IDLE request to all the slave modules in the clock domain is asserted. • The functional clocks to the slave module in enabled state (that is, those whose MODULEMODE values are set to enabled) remain active. • Every enabled optional clock to the modules in the clock domain is provided.
INACTIVE	All clocks within the clock domain are gated. • Every slave module in the clock domain (that is, those whose MODULEMODE value is set to disabled or auto) is in IDLE state and set to disabled or auto mode. • Every master module in the clock domain is in STANDBY state. • Every optional functional clock in the clock domain is gated.

Each clock domain transition behavior is managed by an associated register bit field in the CM_<Clock domain>_CLKSTCTRL[x] CLKTRCTRL PRCM module.

Table 3-12 describes the clock transition mode settings of the clock domain.

Table 3-12. Clock Domain Clock Transition Mode Settings

CLKTRCTRL Bit Value	Selected Mode	Description
0x0	NO_SLEEP	A clock domain sleep transition is never initiated, regardless of the hardware conditions.
0x1	SW_SLEEP	A software-forced sleep transition. The transition is initiated when the associated hardware conditions are satisfied (see Table 3-14).
0x2	SW_WKUP	A software-forced clock domain wake-up transition is initiated, regardless of the hardware conditions identified in Table 3-13.

Table 3-12. Clock Domain Clock Transition Mode Settings (continued)

CLKTRCTRL Bit Value	Selected Mode	Description
0x3	HW_AUTO	Hardware-controlled automatic sleep and wake-up transition is initiated by the PRCM module when the associated hardware conditions are satisfied (see Table 3-13 and Table 3-14).

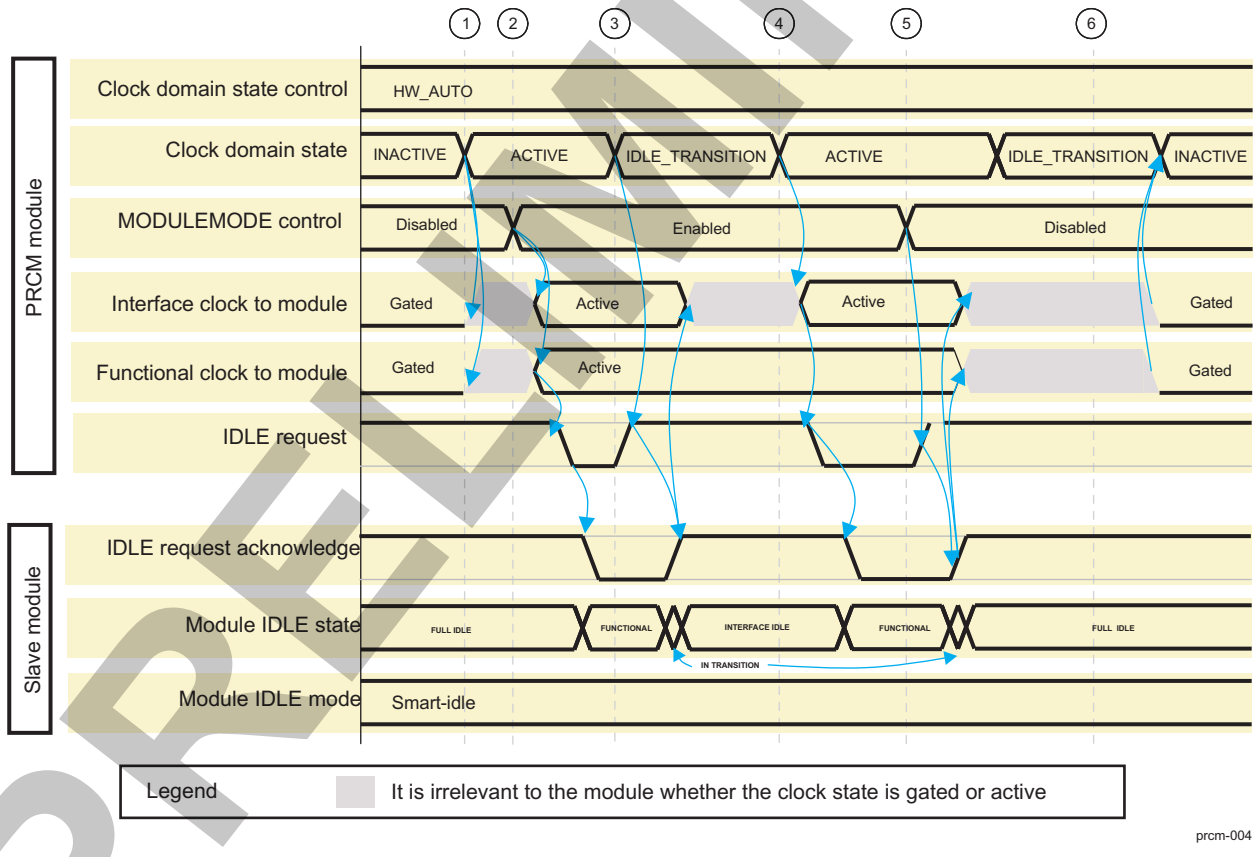
NOTE: Depending on its characteristics, a clock domain may or may not support all the clock transition mode settings described in Table 3-12. See the clock domain clock management section of the specific clock domain to identify the supported clock transition mode settings.

3.1.1.1.5 Clock Domain HW_AUTO Mode Sequences

The sequence diagrams in Figure 3-4 through Figure 3-6 identify the PRCM module hardware-controlled enabling and gating of the functional and interface clocks to the module. They show the changes in the state of the module based on the changes to the clock domain state and module mode settings.

Figure 3-4 shows the behavior of a slave module receiving the interface and functional clocks and having two configurable module modes: disabled and enabled.

Figure 3-4. Clock Domain/Slave Module Clock-Management Interaction Sequence 1



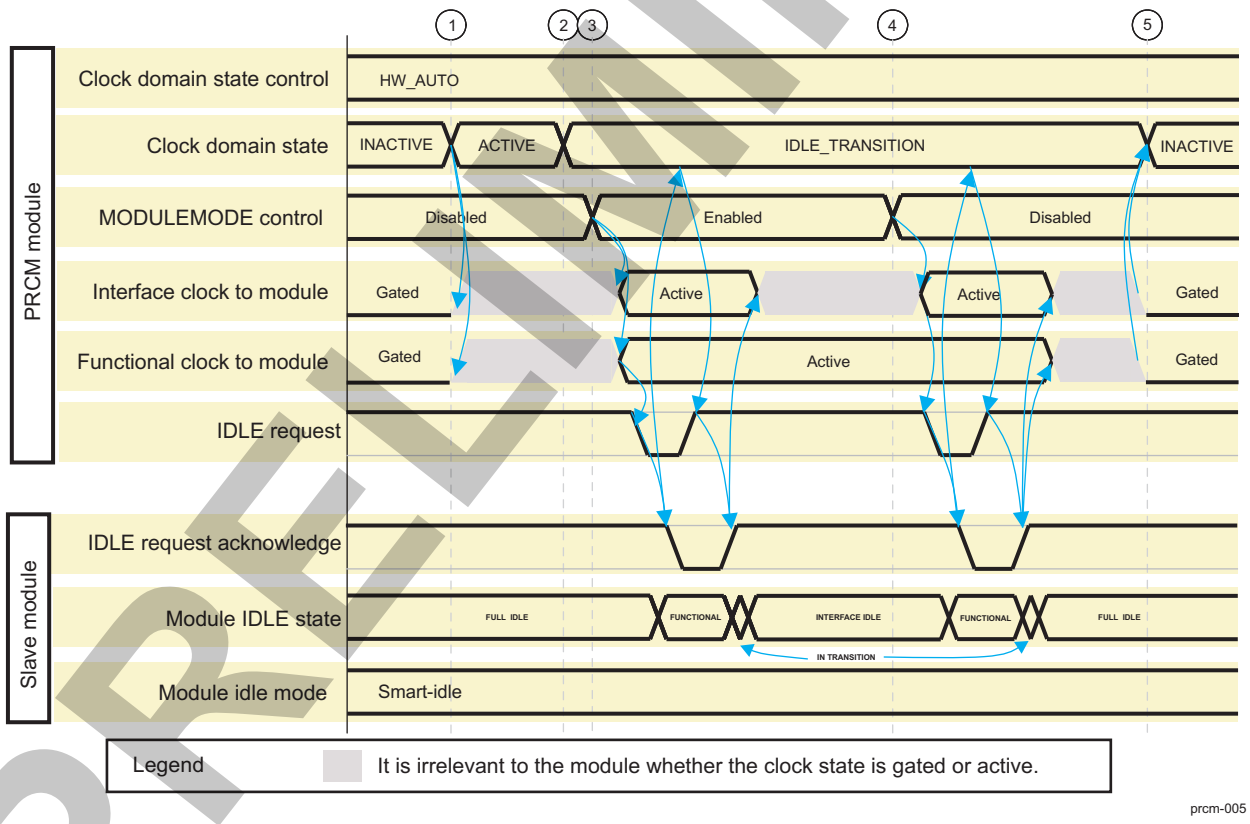
Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL IDLE state and its functional and interface clocks are gated.

1. The clock domain wakes up and changes its state to ACTIVE. Because the MODULEMODE control is still disabled, this event has no effect on the state of the module. The functional and interface clocks can still be restarted automatically, based on the requirements of other modules sharing these clocks.

2. Software changes the module mode to enabled. The clocks to the module are automatically restarted. The PRCM module then deasserts a hardware IDLE request signal to the module. The module sends an IDLE request acknowledge to the PRCM module. The module is now effectively awake. The module IDLE state is functional. If the module is enabled before the clock domain wakes up, Steps 1 and 2 are simultaneous.
3. The clock domain switches to IDLE_TRANSITION state. In turn, the PRCM module requests the module to go into IDLE state by asserting the IDLE request signal. When acknowledged, the clock to the module can be gated, depending on other modules sharing the same clock. The functional clock of the module remains enabled because the module is in enabled mode.
4. The clock domain does not have all conditions to complete the sleep transition and wakes up again. In turn, the interface clock to the module is automatically restarted, if applicable, and then the module is put out of IDLE state.
5. Software disables the module. The PRCM module requests the module to go to IDLE state by asserting the IDLE request signal. When acknowledged, the clock to the module can be gated, depending on other modules sharing the same clock.
6. The clock domain switches to IDLE_TRANSITION state. When the sleep transition conditions of the clock domain are satisfied, the clocks (functional and interface) are gated. The clock domain then switches to INACTIVE state. This has no effect on the module, which is already in FULL IDLE state.

Figure 3-5 shows the behavior of the same slave module, receiving the interface and functional clocks, when the module mode is changed while the clock domain state is IDLE_TRANSITION.

Figure 3-5. Clock Domain/Slave Module Clock-Management Interaction Sequence 2



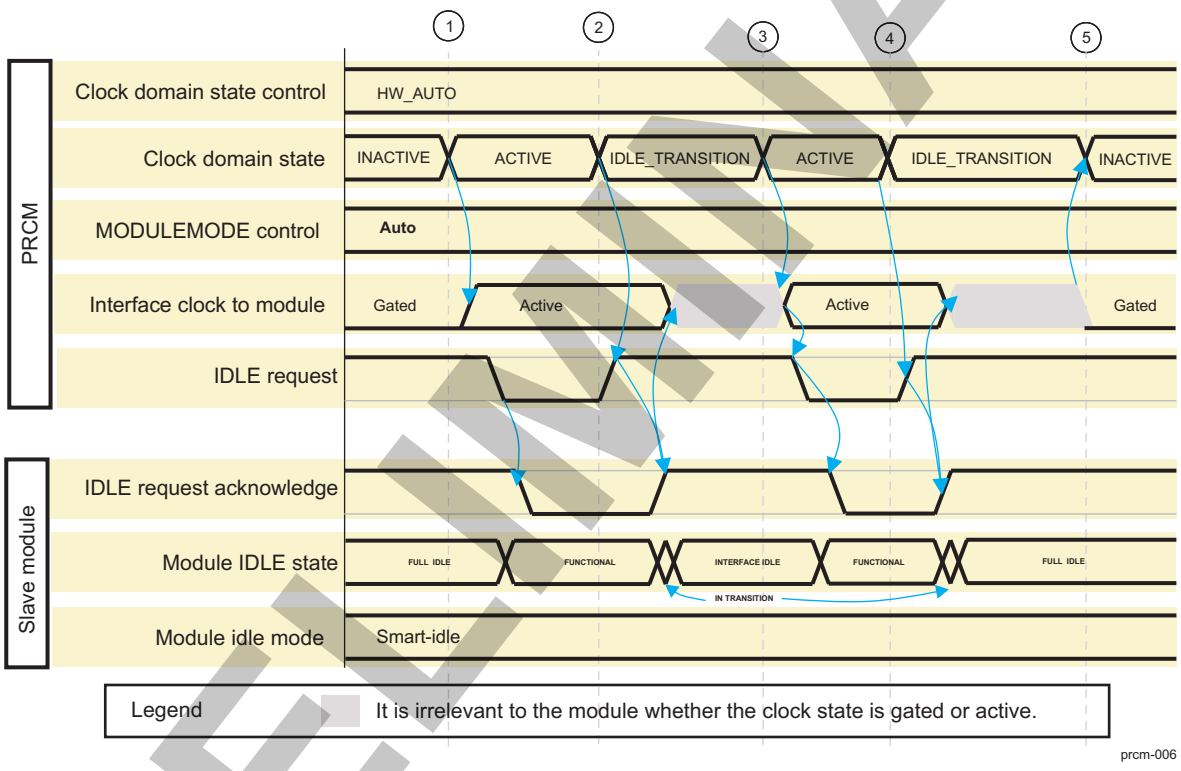
Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL IDLE state and its functional and interface clocks are gated.

1. The clock domain wakes up and changes its state to ACTIVE. Because the MODULEMODE control is disabled, this event has no effect on the state of the module. The functional and interface clocks can still be restarted automatically, based on the requirements of other modules sharing these clocks.
2. The clock domain goes into the IDLE_TRANSITION state. Because the module mode control is disabled, this event has no effect on the module state.

3. Software changes the module mode to enabled. The clocks to the module are restarted automatically and then the module is put out of IDLE state. As soon as acknowledged, the module is requested to go back to IDLE state with gating of the interface clock only (that is, the INTERFACE IDLE state). The interface clock to the module can be gated, depending on other modules sharing the same clocks.
4. Software disables the module. The interface clock to the module is restarted automatically. The PRCM module requests the module to go to IDLE state by asserting the IDLE request signal. When acknowledged, the interface and the functional clocks to the module can be gated, depending on other modules sharing the same clock.
5. When the clock domain sleep transition conditions are satisfied and the functional and interface clocks are gated, the clock domain switches to INACTIVE state. This has no effect on the module, which is already in FULL IDLE state.

Figure 3-6 shows the behavior of a slave module receiving only interface clock and supporting the configurable auto module mode.

Figure 3-6. Clock Domain/Slave Module Clock-Management Interaction Sequence 3



Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL IDLE state and its interface clock is gated.

1. The clock domain wakes up and changes its state to ACTIVE. In turn, the interface clock to the module is automatically restarted. The PRCM module then deasserts a hardware IDLE request signal to the module. The module sends an IDLE request acknowledge to the PRCM module. The module is now effectively awake; that is, the module IDLE state is functional.
2. The clock domain switches to IDLE_TRANSITION state. The PRCM module requests the module to go to IDLE state by asserting the IDLE request signal. When acknowledged, the interface clock to the module can be gated, depending on other modules sharing the same clock.
3. The clock domain does not have all conditions to complete the sleep transition and wakes up again. In turn, the interface clock to the module is automatically restarted, if applicable, and then the module goes out of IDLE state.
4. This step is the same as Step 2.
5. The clock domain has all conditions to complete the sleep transition. The module is in IDLE state and its clock is gated.

3.1.1.1.6 Clock Domain Sleep/Wake-up

The clock domain manager initiates a domain wake-up transition when the conditions listed in Table 3-13 are satisfied.

Table 3-13. Clock Domain Wake-Up Conditions

Relation	Condition
OR	The SW_WKUP clock transition mode for the clock domain is set (CLKTRCTRL = 0x2).
	At least one wake-up request is asserted by one of the modules of the clock domain.
	At least one dynamic dependency(1) from another clock domain is active.
	At least one static dependency(1) from another clock domain is active.
	At least one wake-up dependency(1) from a module in another clock domain is active.

(1) The dynamic, static, and wake-up dependencies are explained in Section 3.1.1.1.7, *Clock Domain Dependency*.

The clock domain manager initiates a domain sleep transition when the conditions listed in Table 3-14 are satisfied.

Table 3-14. Clock Domain Sleep Conditions

Relation		Condition
AND		All master modules in the clock domain are in STANDBY state.
		No wake-up request is asserted by any module of the clock domain.
		No dynamic domain dependency(1) from any other domain is active.
		No wake-up dependency(1) from any module in another domain is active.
		No static domain dependency(1) from any other domain is active.
	OR	The SW_SLEEP clock transition mode is set for the clock domain (CLKTRCTRL = 0x1).
		The HW_AUTO clock transition mode is set for the clock domain (CLKTRCTRL = 0x3).

(1) The dynamic, static, and wake-up dependencies are explained in Section 3.1.1.1.7, *Clock Domain Dependency*.

3.1.1.1.7 Clock Domain Dependency

A domain dependency is a binary relationship between two clock domains. A clock domain A is said to depend on a clock domain B when a module in clock domain B provides services to a module in clock domain A. As a result, clock domain B must be active when clock domain A is active so that the module in clock domain B is accessible by the module in clock domain A.

Dependency between two clock domains can also exist if one clock domain serves to ensure communication between two modules (for example, the clock domain of the device interconnect).

Thus, a clock domain can support the types of clock domain dependencies described in the following sections.

Table 3-15 and Table 3-16 detail all the domain dependencies:

- **NA/NA**: if no dependency can exist because no corresponding interconnect path exists in the device
- When cell is different than NA/NA, the cell contains two attributes:
  - First attribute for the presence and control method of a static dependency:
    - **SW**: Static dependency is controlled by a software bit. This is the most generic way of control. Depending on the use case and on latency requirement for accessing target domain, software can enable or not the static dependency. When not enabled, access to those domains is performed using dynamic dependencies.
    - **1**: Static dependency is always enabled (hard-wired). This is relevant for a domain that has an "exact standby" system initiator with the target domain being the domain containing the interconnect module to which the initiator is connected.
    - **0**: Static dependency is never enabled (hard-wired). This is relevant for domains that do not have strong access latency requirements, or for which a static dependency is not desired for

specific reasons (for example, dependencies with emulation domain). Access to those domains is performed using dynamic dependencies.

- **NA**: Nonapplicable (means domain has no system initiator able to access the other domain)

– Second attribute for the presence and control method of a dynamic dependency:

- **1..n**: Dynamic dependency is always enabled (hard-wired). The number of corresponding interconnect interfaces is also specified. This is relevant for most of the domain-to-domain direct interconnect connection.
- **0**: Dynamic dependency is never enabled (hard-wired). This is relevant only when a static dependency is always enabled between same domains, or when the target domain cannot support the wakeup on access feature.
- **NA**: Nonapplicable (means that both domains are not directly linked by an OCP interface)

Table 3-15. Device Domain Dependencies (Table 1)

When a static dependency is hardware-coded between two domains directly linked by one or several interconnect interfaces, then the corresponding dynamic dependency is useless.

Emulation domain (DAP initiator) has no static dependency with any other domain. It has, however, a dynamic dependency with the L3_MAIN2 interconnect. A domain that can access an emulation domain does not have static or dynamic dependency with it.

Domain dependencies are chosen such that any access (even from EMU/DAP) towards a nondisabled target is always completed normally. Using static dependencies allows having minimal access latencies by keeping necessary domains on whenever the initiator is not standby. This may be at the expense of additional power consumption because some domains may stay on while not in use for a long time. By disabling static dependencies, applicative access is still completed normally by waking up, if applicable, the necessary domain on the path from the initiator to the target. Power consumption can be optimized at the expense of additional access latencies.

NOTE: It is required to put destination domain into forced wakeup (CLKTRCTRL = SW_WKUP) before changing a configurable static dependency.

3.1.1.1.7.1 Static Dependency

If clock domain A has a master module that can access a slave module in clock domain B, then clock domain A can have a static dependency with clock domain B. Similarly, a static dependency can also exist between domain A and B if domain B conveys the transactions from a domain A module toward a module in any other domain. For example, CD_DSP can have a static dependency with CD_L3_MAIN1 because this domain has a level 3 (L3) interconnect to carry the transactions from the digital signal processor (DSP) module.

This static dependency consists of forcing clock domain B to stay active as long as there is at least one master module of clock domain A that is not in STANDBY state. If clock domains A and B are initially in GATED state, then clock domain B becomes active as soon as clock domain A becomes active when a wake-up request from the master module is received by the PRCM module.

Similarly, as a result of the static dependency, clock domain B can be gated only if all the master modules of clock domain A that can access the slave modules in clock domain B are in STANDBY state.

The static dependency between a source clock domain and a destination clock domain is configured in the PRCM module by setting the CM_<Source Clock domain>_STATICDEP[x] <Destination Clock domain>_STATDEP bit. As a result, the source clock domain forces the destination clock domain to become active and stay active as long as the source clock domain is active.

The destination domain must be put into forced wake-up (CM_<X>_CLKSTCTRL[1:0] CLKTRCTRL = SW_WKUP) before changing a configurable static dependency.

3.1.1.1.7.2 Dynamic Dependency

When clock domains A and B contain modules directly linked to a common device interconnect, these clock domains can have a dynamic dependency.

A dynamic dependency consists of forcing clock domain B to stay active as long as a module from clock domain A is communicating with the module in clock domain B through the interconnect. Clock domain B becomes active as soon as the communication is initiated. This is automatically managed by the PRCM module by monitoring the communication on the interconnect between the modules of the two clock domains.

Similarly, the inverse condition of this dependency can be stated: Clock domain B can be inactive only if all modules between clock domains A and B are quiet for a given sampling delay, identified as a sliding window duration on the interconnect activity status.

The size of the sliding window is based on the number of cycles of a prescaled level 4 (L4) clock whose frequency is configured by setting the CM_DYN_DEP_PRESCAL[5:0] PRESCAL bit field. The prescaled clock frequency is given as:

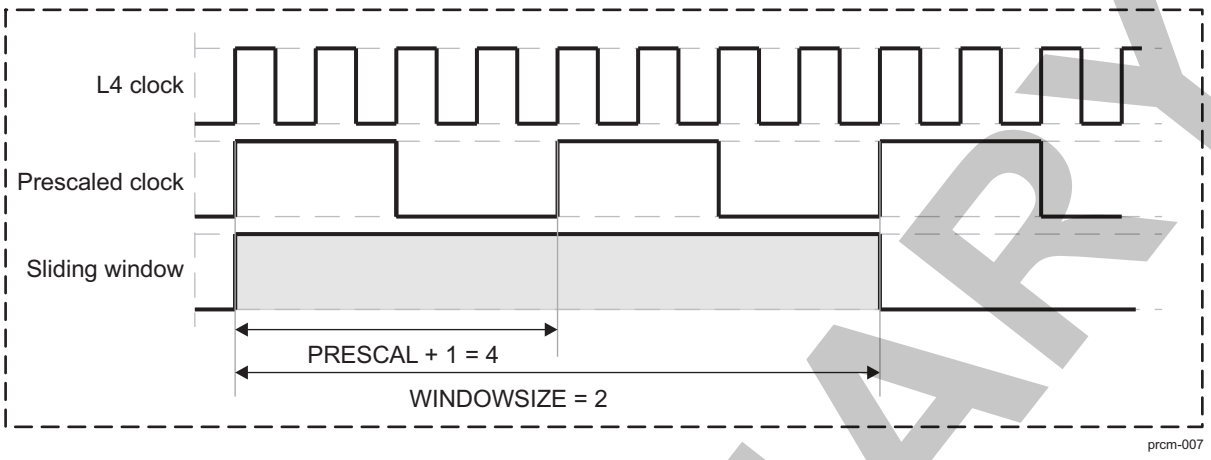
Prescaled clock frequency = L4 interface clock frequency / (PRESCAL + 1)

The size of the sliding window is fixed by setting the CM_<Clock domain>_DYNAMICDEP[27:24] WINDOWSIZE bit field. It is given as:

Sliding window duration = WINDOWSIZE × Period of Prescaled clock cycle

Figure 3-7 is an example of the sliding window duration equal to eight clock cycles of an L4 clock when PRESCAL is set to 3 and WINDOWSIZE is set to 2.

Figure 3-7. Sliding Window for Dynamic Dependency



This dynamic dependency is also referred to as the autosleep/autowakeup feature.

NOTE:

- The static dependency between two clock domains can be configured by software (PRCM module registers) or hardwired in the PRCM module.
- The dynamic dependency between two clock domains is hardwired in the PRCM module.

A dynamic dependency is said to be active when both of the following conditions are met:

- At least one master module or a slave interconnect module from clock domain A to domain B is active (that is, the master module is not in STANDBY state and/or the interconnect slave module is not in IDLE state)
- There has been one or more transaction on the interconnect within the sliding window duration.

Otherwise, a dynamic dependency is said to be inactive.

The dynamic dependency between a source clock domain and a destination clock domain can be read in the PRCM module from the corresponding read-only CM_<Source Clock domain>_DYNAMICDEP[x] <Destination Clock domain>_DYNDEP bit.

NOTE: It is recommended to use dynamic dependencies. They give better power results. Static dependencies should be rarely used (in some cases they can be used as they give shorter latency for a system initiator to access slave).

3.1.1.1.7.3 Wake-Up Dependency

A wake-up dependency is a dependency between the clock domain of a module that owns one or several wake-up signals toward the clock domain of another module needed to service the associated wake-up event. As a result of this dependency, the wake-up event to a module activates not only its clock domain but also the clock domain of the servicing module.

NOTE: To ensure that the clock domain of the servicing module remains active, the wake-up signal that triggers a wake-up dependency stays active as long as the source of the event is not serviced.

Wake-up dependencies allow acceleration of the wake-up transition of multiple domains needed to service the wake-up event by initiating their transition in parallel. The static and dynamic dependencies can allow the wake-up of related domains, but the complete wake-up transition of all the associated domains is slower because of the sequential cascading of their wake-up transitions.

In the device, the source event of the wake-up signal to a slave module can be either of following types:

- Interrupt request to the microprocessor unit (MPU), DSP, or image processor unit (IPU) interrupt controller (INTC)
- DMA request to a DMA controller

Upon wake-up by these types of wake-up events, and for as long as they remain asserted, the PRCM module takes the following actions:

- The power domain of the servicing module (for example, MPU, DSP, IPU, or DMA) is forced to POWER ON state and the clock domain becomes active.
- The power domain of the device interconnect between the servicing module and the module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.
- The power domain of the slave module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.
- The slave module originator of the wake-up event is switched from IDLE to ACTIVE state.

On assertion of a wake-up event of a stand-alone master module, and as long as it remains asserted, the PRCM module takes the following action:

- The power domain of the master module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.

NOTE: For slave modules, the static and dynamic dependencies of a clock domain are not affected by its wake-up dependency settings. For master modules, the static dependencies are not affected.

Hence, in addition to the activation of the clock domains previously described, all clock domains associated by static dependencies are also activated.

However, the clock domains associated with the wake-up clock domain through dynamic dependencies are activated only if a transaction is initiated to these clock domains.

For each wake-up signal coming from a slave module, the type of the corresponding event can be configured in the PM_<Power domain>_<Originator Module> _WKDEP[x] WKUPDEP_<Originator Module>_<Servicing Module> bit of the PRCM module, where <Power domain> is the name of the power domain of the originator module of the wake-up event identified as <Originator Module>. Servicing Module refers to the module servicing the wake-up event.

NOTE: When only one event type is associated with the wake-up signal of a slave module, the wake-up dependency (WKUPDEP) for the module clock domain is not configurable and may be hardwired in the PRCM module.

For the master modules, there is no configurable wake-up dependency. Their power domain is switched on and their clock domain is activated by the PRCM module when they assert their wake-up signal.

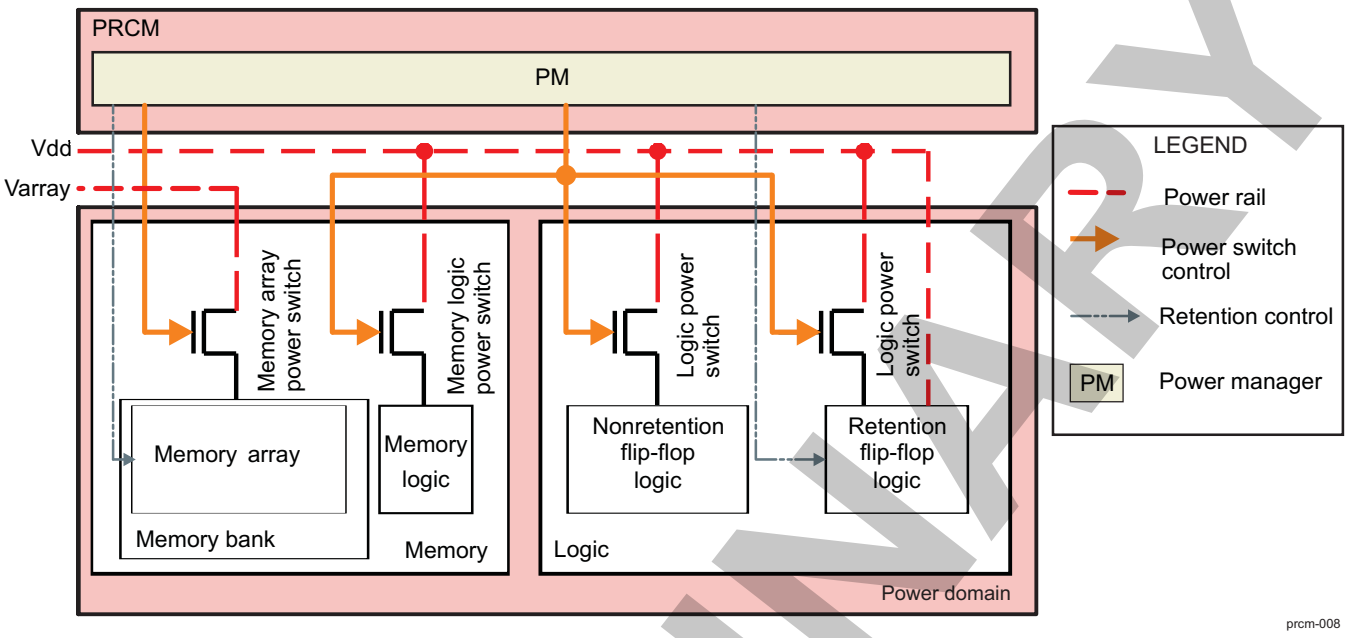
3.1.1.2 Power Management

The PRCM module manages the switching on and off of the power supply to the device modules. To minimize device power consumption, the power to the modules can be switched off when they are not in use. Independent power control of sections of the device lets the PRCM module turn on and off specific sections of the device without affecting other sections.

3.1.1.2.1 Power Domain

A power domain is a section (that is, a group of modules) of the device with an independent and dedicated power manager (see Figure 3-8). A power domain can be turned on and off without affecting other parts of the device.

Figure 3-8. Generic Power Domain



To minimize device power consumption, the modules are grouped into power domains. A power domain can be split into logic and memory areas.

The memory area contains two entities:

- Memory bank: Composed of memory arrays. It is powered by a dedicated voltage rail and an associated power switch (for example, Varray and memory array power switches).
- Memory logic: Powered by the same voltage source as the logic area of the power domain, but has its dedicated power switch (for example, Vdd and memory logic power switches)

The logic area in the power domain can also be split between retention flip-flops (RFFs) and nonretention flip-flops (DFFs).

Table 3-17 lists the possible states and substates of the logic area in a power domain.

Table 3-17. States of a Logic Area in a Power Domain

State	Substate	Description
ON	ON-ACTIVE	Logic is fully powered and at least one enclosed clock domain is active.
	ON-INACTIVE	Logic is fully powered and all enclosed clock domains are idled.
RETENTION	CSWR (close switch retention)	Logic is fully powered and all enclosed clock domains are idled.

The RETENTION state is useful for quickly switching to low-power idle mode (in which the domain clocks are gated and the domain voltage is less than the on-voltage level) without losing the context, and then quickly switching back to ON-ACTIVE state when necessary. In RETENTION state, power consumption is less than in ON power state.

Similarly, in RETENTION state the CSWR state has faster turn-on times and higher leakage currents.

The behavior of the memory array power switch and memory logic power switch can be selected through software settings in the PRCM module or can be hardwired. Once the behavior is selected, the PRCM module hardware automatically handles these elements to ensure correct power transition sequencing between the power domain states.

Software can also initiate power state changes of the memory array when the associated power domain is in ON power state. This allows the memory array to be turned off and on as needed.

The memory area can be configured to any of the power states listed in Table 3-18.

Table 3-18. States of a Memory Area in a Power Domain

State	Description
ON	The memory array is powered and fully functional.
RETENTION	The memory array is fully powered, but memory is not accessible. The array can be put into retention through an applicable direct retention control signal. Data in memory are always retained.

3.1.1.2.2 Module Logic and Memory Context

In case of a power state transition in the logic or memory areas, the context of the module may no longer be valid. This can also be the case when the domain resets are asserted by the device. A specific RM_<Clock Domain Name>_<Module Name>_CONTEXT register provides the status of the device logic and memory context.

- The module logic context consists of simple flip-flops (DFFs) if the module has no logic RFFs.
- If the module has logic retention (full or partial), it is assumed that the context consists only of RFFs.

NOTE: The display subsystem is an exception where the status of DFF and RFF context is given, because only HMDI keys are retained, while most of the display subsystem is not retained.

These context status bits must be cleared by software.

3.1.1.2.3 Power Domain Management

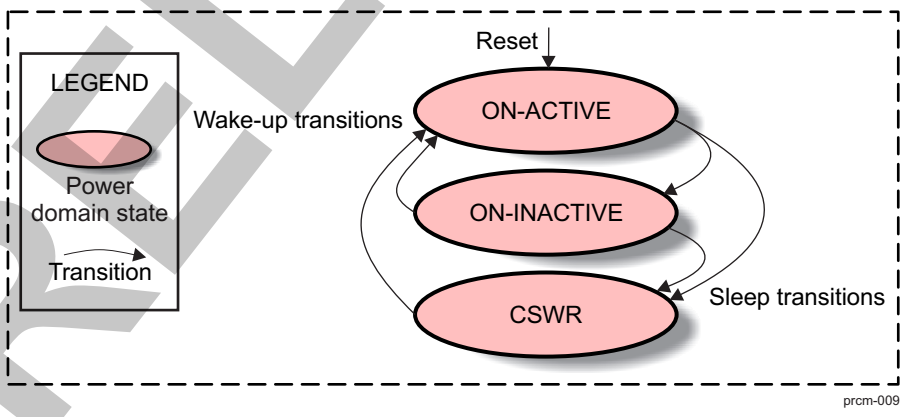
The power manager associated with each power domain is assigned the task of managing the domain power transitions. It ensures that all hardware conditions are satisfied before it can initiate a power domain transition from a source to a target power state (for example, from ON-ACTIVE state to CSWR RETENTION state).

The hardware condition for power domain transition from ON-ACTIVE to any other transition state is:

- All clock domain managers in the power domain are in ON-INACTIVE state: All modules in the domain are in IDLE or STANDBY state, and there is no constraining dependency (static, dynamic, or wake-up dependency) between the clock domains blocking the clock domain sleep transition.

Figure 3-9 shows all possible power domain state transitions.

Figure 3-9. Power Domain Transitions



Successive power-down transitions can be performed by lowering the power state from ON-ACTIVE to ON-INACTIVE, and then to RETENTION, as long as the hardware condition is satisfied.

However, the power domain wake-up transition from any low-power state (ON-INACTIVE or CSWR) to ON-ACTIVE state is always direct. For example, user software cannot request a power domain transition from the ON-INACTIVE state to the CSWR state, but only to the ON-ACTIVE state.

The power domain manager initiates a power domain wake-up transition when the conditions listed in Table 3-19 are satisfied.

Table 3-19. Power Domain Wake-Up Conditions

Relation		Condition
AND		Voltage domain is on.
	OR	There is at least a wake-up condition for one enclosed functional clock domain.
		There is a request for clock generation or distribution enclosed in the power domain.
		There is a PRCM module service request (applicable only to power domains, including PRCM module logic).

The power domain manager initiates a domain sleep transition when the conditions listed in Table 3-20 are satisfied.

Table 3-20. Power Domain Sleep Conditions

Relation	Condition
AND	All functional clock domains enclosed in the power domain are idled.
	All clock generation or distribution enclosed in the power domain is quiet, and corresponding input clocks are gated. For example, DPLL, if present, must be in stop mode.
	There is no PRCM module service request (applicable only to power domains, including PRCM module logic).

Table 3-21 lists the control and status features of the PRCM module power domain.

Table 3-21. Power Domain Control and Status Registers

Register/Bit Field	Type	Description
PM_<Power domain>_PWRSTCTRL[1:0] POWERSTATE	Control	Selects the target power state of the power domain among ON-ACTIVE, ON-INACTIVE, and RETENTION
PM_<Power domain>_PWRSTCTRL[x] LOWPOWERSTATECHANGE	Control	Power state change request when domain has already performed a sleep transition. Allows going into deeper low-power state without waking up the power domain.
PM_<Power domain>_PWRSTCTRL[2] LOGICRETSTATE	Control	Selects whether the power domain logic is in CSWR RETENTION state when the domain transitions to RETENTION state
PM_<Power domain>_PWRSTCTRL[x] <memory bank>_RETSTATE	Control	Selects whether the memory bank in the power domain is in ON or RETENTION state when the power domain is in RETENTION state. The memory bank cannot be in ON state when the power domain is in RETENTION state.
PM_<Power domain>_PWRSTCTRL[x] <memory bank>_ONSTATE	Control	Selects whether the memory bank is in the ON or the RETENTION state when the power domain is in the ON state
PM_<Power domain>_PWRSTST[1:0] POWERSTATEST	Status	Identifies the current state of the power domain. It can be RETENTION, ON-INACTIVE, or ON-ACTIVE.
PM_<Power domain>_PWRSTST[2] LOGICSTATEST	Status	Identifies the current state of the logic area in the power domain.
PM_<Power domain>_PWRSTST[20] INTRANSITION	Status	Identifies whether a power state transition in the power domain is in progress or there is no ongoing transition
PM_<Power domain>_PWRSTST[x] <memory bank>_STATEST	Status	Identifies the current power state of the memory bank in the power domain. It can be RETENTION or ON.
PM_<Power domain>_PWRSTST[25:24] LASTPOWERSTATEENTERED	Status	Identifies the last (previous) power state of the power domain. It can be RETENTION, ON-INACTIVE, or ON-ACTIVE.

3.1.1.3 Voltage Management

The PRCM module controls the voltage scaling (that is, switching the voltage in discrete steps or in a continuum within a range of possible values) of the power sources of the device. This allows control of the power consumption of the device according to the defined performance criteria. Higher performance is ensured with higher voltage and clock frequencies (and hence higher power consumption), while lower performance can be supported with lowered power consumption by reducing or completely gating the power supply to specific areas of the device and gating the associated clocks.

3.1.1.3.1 Voltage Domain

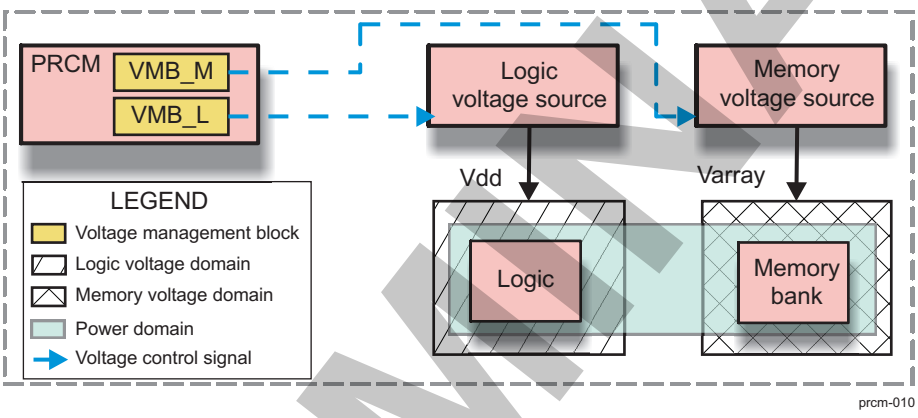
A voltage domain is a section of the device supplied by a dedicated voltage source (that is, an internal LDO or external switch mode power supply [SMPS]). A voltage domain may or may not be controlled by the PRCM module. When a voltage domain is controlled by the PRCM module, a dedicated voltage manager is associated. The voltage manager allows regulation of the voltage level of the source for the voltage domain independently of other voltage domains of the device.

The voltage managers in the PRCM module can be of two types:

- Dynamically configurable by software to scale the domain voltage level to specific values within the operational voltage range of the device. This is called adaptive voltage scaling (AVS).
- Hardware-controlled to automatically switch the domain voltage levels according to the associated hardware conditions.

Figure 3-10 shows a voltage domain.

Figure 3-10. Generic Voltage Domain



By partitioning the device into independent voltage domains, different operating voltages can be assigned to the different sections of the device (that is, a group of modules or memory banks). The independent voltage control allows voltage scaling of device subsections to ensure that each module or memory bank operates at the optimized operating voltage level based on the application performance requirements. When all modules within a voltage domain are idle (that is, have no ongoing transaction), the domain voltage can be lowered to reduce power consumption and then switched back to normal operating voltage level when a wake-up event is received by one of the modules of the voltage domain. Similarly, when a memory bank is not in use, it can be switched to retentionvoltage levels to ensure power savings.

Table 3-22 describes the different states of the logic voltage domain.

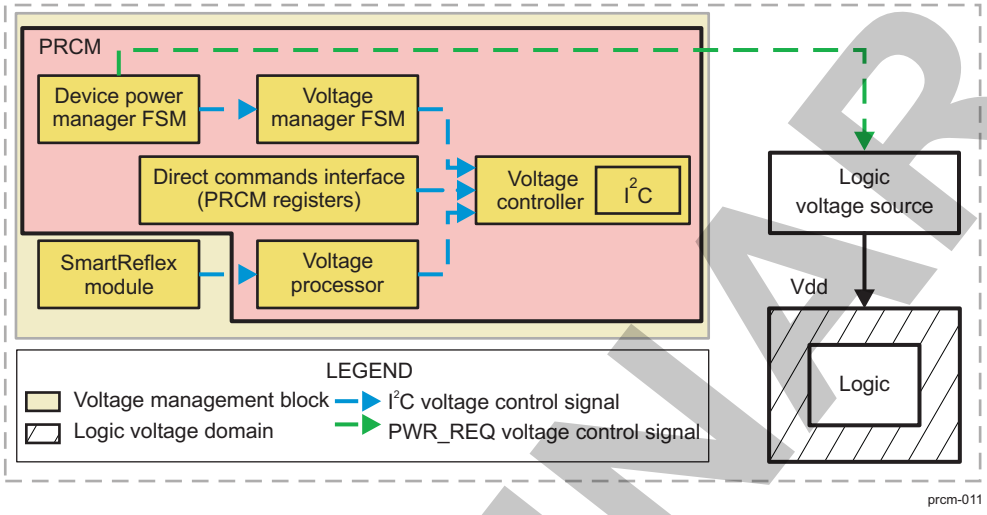
Table 3-22. States of Logic Voltage Domain

State	Description
ON	The voltage regulator source for the voltage domain is active and operating in its normal voltage range for the current operating performance point (OPP) and can deliver up to the maximum load current defined for the current OPP.
SLEEP	The voltage regulator source is operating in its normal voltage range, but it can deliver only a limited load current (no logic activity on this voltage domain). In sleep mode, regulator power consumption is reduced.
RETENTION	The voltage regulator source is operating at retention voltage level. It delivers the minimal load current required to maintain the voltage domain logic context.

3.1.1.3.2 Voltage Domain Management

Figure 3-11 shows the different voltage control paths available within a generic logic voltage management block to control the voltage supply to the logic voltage domains of the device.

Figure 3-11. Generic Logic Voltage Management



3.1.1.3.2.1 Logic Voltage PWR_REQ Voltage Control

A PWR_REQ signal is deasserted when the device needs to change its current power state to other. The external power integrated circuit (IC) can be used to properly manage turn-off or turn-on of the logic voltage source.

3.1.1.3.2.2 Logic Voltage I^2C Voltage Control

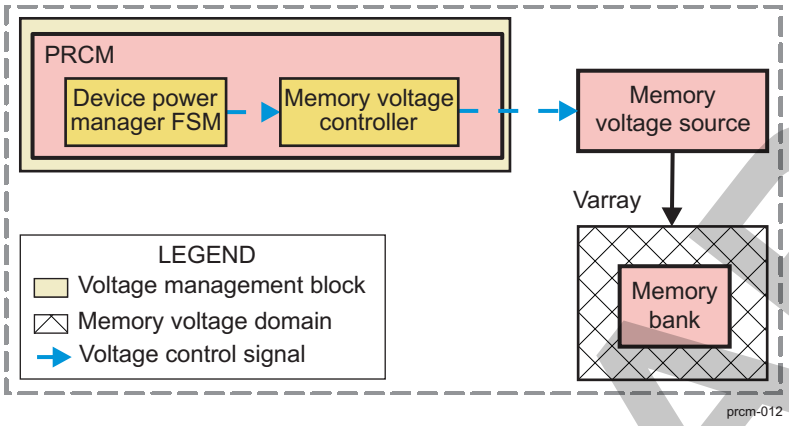
The PRCM module allows three voltage control paths to a dedicated inter-integrated circuit (I^2C™) interface for the logic voltage domains it manages:

1. The hardware-managed voltage of the PRCM module changes from device power manager voltage finite state-machine (FSM) through a voltage manager FSM based on hardware conditions. It sends the voltage commands when the device enters the RETENTION state and upon device wakeup.
2. Direct control by user software through the PRCM module registers for voltage scaling
3. AVS (see Section 3.1.1.3.3, *AVS Overview*) with SmartReflex™ voltage control commands through the voltage processor

NOTE: An I^2C host module (not controlled by the PRCM module) can be used to program the external power IC. Because this procedure completely bypasses the PRCM module, see Section 23.1, *I^2C*.

Figure 3-12 shows the voltage control path available within a generic memory voltage management block to control the voltage supply to the memory voltage domains of the device.

Figure 3-12. Generic Memory Voltage Management



The PRCM hardware supports automatic scaling down of the memory array supply whenever the memory domains transition to the RETENTION power state. The device power manager FSM manages the voltage scaling of memory voltage domains through the memory voltage controller (or LDO).

3.1.1.3.3 AVS Overview

SmartReflex is a power-management technique used to control the operating voltage of a device to reduce its active power consumption.

With SmartReflex, the power supply voltage is adapted to the silicon performance in two ways:

- Statically adapted to the manufacturing process of a given device
- Dynamically adapted to the temperature-induced current performance of the device

SmartReflex achieves optimal performance/power trade-off for all devices across the technology process spectrum and across temperature variations.

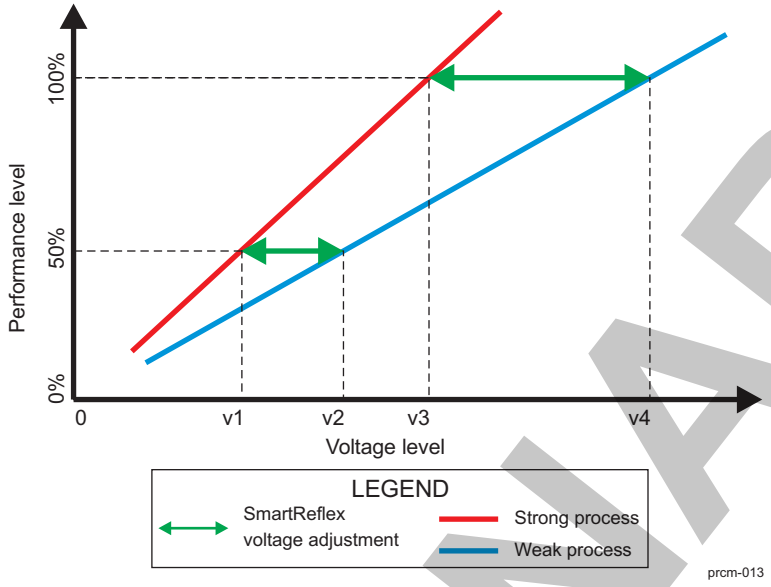
The static correction of the device voltage level (see Figure 3-13) is based on the desired performance level and silicon performance characteristics of the device. As a result of process dispersion, each die has its specific silicon performance. The range of the process distribution defines the weak devices (low-performance silicon) and the strong devices (high-performance silicon).

A weak device is a device with the lowest performance tolerated for a process distribution; that is, at the typical voltage, the inherent maximum frequency is the lowest frequency of the chip distribution. Considered as the worst case, weak devices are used to constrain the target frequency of all the chips (OPP definition).

A strong device is a device with the highest performance tolerated for a process distribution. The inherent maximum frequency at the typical voltage is greater than the targeted frequency.

Figure 3-13 shows that with the SmartReflex voltage-control architecture, it is possible to compensate for the device silicon characteristics and obtain optimal performance characteristics. Based on the device characteristics, the device voltage level can be adjusted for specific performance level.

Figure 3-13. SmartReflex Static Voltage Adjustment

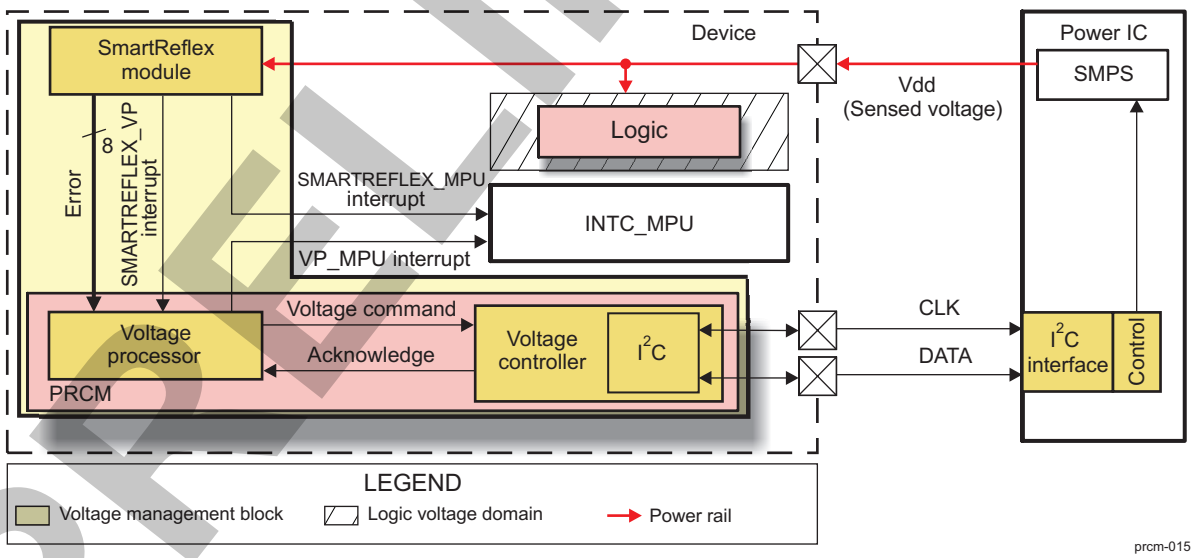


The dynamic correction of the device voltage is based on the real-time comparison of predefined performance points to the on-chip measured performance level. The device voltage level is raised or lowered to compensate for temperature-induced performance variations.

Without SmartReflex, the voltage variation is near the nominal voltage level and is not controlled through any active dynamic compensation. This leads to power waste.

Figure 3-14 is a functional overview of the SmartReflex voltage-control architecture of the device connected to an external power IC.

Figure 3-14. SmartReflex Voltage Control Functional Overview



SmartReflex voltage control consists of the following modules:

- SmartReflex
- INTC_MPU
- Voltage processor
- Voltage controller
- I^2C interface

- SMPS

The SmartReflex module senses input voltage (Vdd) and generates an error value that identifies the difference between the desired optimal voltage and the actual value of the SMPS. This error value is set in an internal register (for software read, if necessary) and is also passed to the voltage processor.

The voltage processor converts the error value to a voltage command that defines the change in the output voltage of the SMPS required to bring it to the desired voltage level.

The voltage command is sent to the voltage controller, which passes it to the power IC through the dedicated I^2C interface. The power IC then adjusts the output voltage of the SMPS according to the command.

In this way, the SmartReflex module dynamically adjusts the SMPS voltage to compensate for voltage variations.

The device supports Class 1.5 for SmartReflex voltage control or software-controlled hardware calibration mechanism.

3.1.1.3.3.1 Class 1.5 SmartReflex Voltage Control

SmartReflex Class 1.5 is a software controlled hardware calibration mechanism designed to improve DVFS latencies and system performance. When SmartReflex modules are used in class 1.5, the Voltage Processors should be disabled. Here the calibration is only at boot time.

In SmartReflex Class 1.5, the calibration procedure is triggered by the user software (for example once per day or week) to account for device aging. Additional temperature margins are fused, thus no user software is involved.

3.1.2 Power-Management Techniques

The following sections describe the power-management techniques supported by the device.

NOTE: The values in Figure 3-15 through Figure 3-17, which show the power-management techniques, are hypothetical. They do not represent valid test results on the device.

3.1.2.1 Standby Leakage Management

Standby leakage management (SLM) is a power-management technique that reduces standby power consumption by reducing power leakage.

With SLM, the device switches into low-power system modes automatically or in response to user requests during system standby (that is, in situations when no application is started and system activity is negligible or limited).

When applying SLM, the system remains in the lowest static power mode compatible with the system response time requirement.

This technique trades static power consumption for wake-up latency.

3.1.2.2 Dynamic Voltage and Frequency Scaling

Dynamic voltage and frequency scaling (DVFS) consists of minimizing the idle time of the system. The DVFS technique uses dynamic selection of the optimal operating frequency and voltage to allow a task to be performed in the required length of time. This reduces the active power consumption (power consumed while executing a task) of the device while still meeting task requirements.

NOTE: The values in Figure 3-15 are hypothetical. They are meant only to clarify the concept and do not represent valid test results on the device.

Figure 3-15. Comparison of Energy Consumed With/Without DVFS

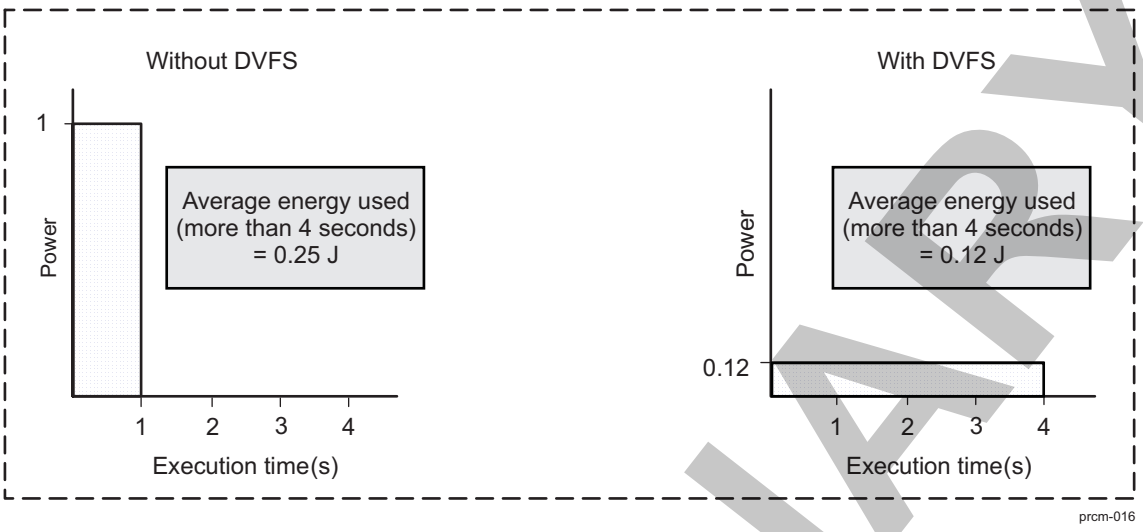


Figure 3-15 shows the DVFS technique by comparing a process executed at maximum frequency and operating voltage without applying DVFS to the same process executed at optimal frequency and voltage using DVFS, based on the task requirements. If a task that must terminate in 4 seconds is performed at maximum operating frequency (see the left side of the figure), it terminates in 1 second, and the remaining 3 seconds are spent in idle mode.

With DVFS (see the right side of the figure), the operating frequency is reduced to optimal level; the task takes the full 4 seconds to complete, but power consumption is reduced. In addition, the voltage can be reduced further to save power so the dynamic and leakage power consumption are reduced.

DVFS requires control over the clock frequency and the operating voltage of the device elements. By intelligently switching the individual elements of the device to their OPPs, the power consumption of the device for a given task can be minimized.

For practical reasons related to the development of the device (flow, tools), DVFS can be used only for a few discrete steps, not over a continuum of voltage and frequency values. Each step, or OPP, is composed of a voltage (V) and frequency (F) pair. For an OPP, the frequency corresponds to the maximum frequency allowed at a voltage, or reciprocally; the voltage corresponds to the minimum voltage allowed for a frequency.

When applying DVFS, a processor or system always runs at the lowest OPP that meets the performance requirement at a given time. The user determines the optimal OPP for a given task and then switches to that OPP to save power.

3.1.2.3 Dynamic Power Switching

Like DVFS, dynamic power switching (DPS) is a power-management technique intended to reduce the active power consumption of a device. However, whereas DVFS reduces dynamic and leakage power consumption, DPS reduces only leakage power consumption, at the expense of a slight overhead in dynamic power consumption.

With DPS, the system switches dynamically between high- and low-consumption system power modes during system active time. When DPS is applied, a processor or system runs at the highest OPP (maximum frequency and voltage) to complete its tasks quickly, followed by an automatic switch to a low-power mode for minimum power consumption. DPS is useful when a real-time application is waiting for an event. The system can switch into a low-power system mode if the wake-up latency conditions allow it.

This technique consists of maximizing the idle period of the system to reduce its power consumption.

NOTE: The values in Figure 3-16 are hypothetical. They are meant only to clarify the concept and do not represent valid test results on the device.

Figure 3-16. Comparison of Energy Consumed With/Without DPS

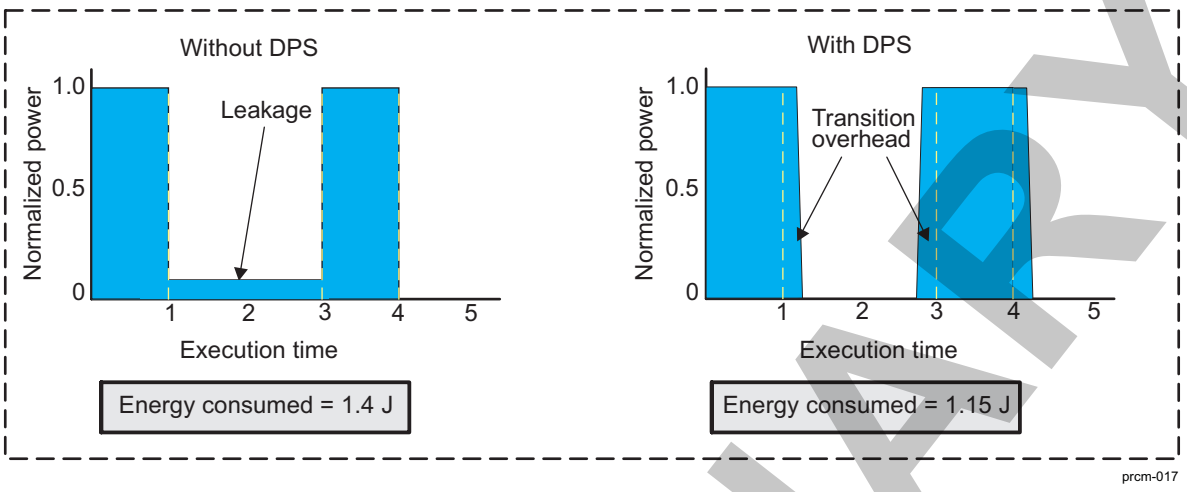

Figure 3-16 compares the behavior of power consumption for the same operation of the device without DPS (see the left side of the figure) and with DPS (see the right side of the figure). When operating without DPS, the device has a constant leakage current in idle mode. By using DPS, the system reduces the leakage current to 0. However, the transitions between system power modes may require storing the information before entering a low-power inactive state and restoring the information after a wake-up event (see Figure 3-16). This results in additional dynamic power consumption, referred to as transition overhead (see Figure 3-16). Transition overhead must be considered for a DPS operation.

For efficient deployment of DPS techniques, it is necessary to predict dynamically the performance requirement of the applications running on the processor. The DPS controller must account for the overhead of wake-up latencies related to domain switching and ensure that they do not significantly affect the performance of the device. Even with transition overhead, the user can identify an optimal idle-time limit, after which the DPS is useful for dynamic power saving.

3.1.2.4 Adaptive Voltage Scaling

SmartReflex-based AVS is a power-management technique for automatic control of the operating voltages of the device to reduce active power consumption.

With SmartReflex, power-supply voltage is adapted to silicon performance, either statically (based on performance points predefined in the manufacturing process of a given device) or dynamically (based on the temperature-induced real-time performance of the device). A comparison of these predefined performance points to the real-time on-chip measured performance determines whether to raise or lower the power supply voltage.

AVS achieves the optimal performance/power trade-off for all devices across the technology process spectrum and across temperature variation. The device voltage is automatically adapted to maintain performance of the device. This ensures optimal power consumption for a given OPP.

With AVS, the frequency steps are identified and the voltage is adapted according to the silicon performance of the device. In this case, instead of a voltage step for each frequency step, there is a corresponding range of voltages. The range depends on the fabrication process of the device and its real-time operating state (temperature) at a given frequency.

3.1.2.5 Adaptive Body Bias

The device implements transistor body bias techniques for forward body bias (FBB) to boost the operating clock frequency for operation at higher OPPs.

Adaptive body bias (ABB) is based on the process corner and the current OPP. This is configured in the EFUSE_CTRL_CUST bit field at the device characterization and is not continuously updated. A dedicated LDO (VBBLDO) is used to produce the voltage bias.

ABB is supported only for MPU and MM domains.

3.1.2.6 SR3-APG (Automatic Power Gating)

In addition to power-management techniques supported in the device, the MPU subsystem also employs SR3-APG power-management technology to reduce leakage. This technology allows for full logic and memory retention on MPU_C0 and MPU_C1 when required conditions are satisfied. It is controlled by the PRCM_MPU. For more information, see Chapter 4, *Dual Cortex-A15 MPU Subsystem*.

3.1.2.7 Combining Power-Management Techniques

The power-management techniques previously described have specific features and are most effective when used under the specific operating conditions of the device. Hence, the best active power savings are obtained by combining the DVFS, DPS, SLM, and AVS techniques. For a given operating state, one or more of the power-saving techniques can be applied to ensure optimal operation with maximum power saving.

AVS can be used at boot time to adapt the voltage to the process characteristics (strong/weak) of the device and then be used continuously to compensate temperature variations. AVS can also ensure the maximum available application performance of the device at a given OPP.

When medium application performance is required, or when application performance requirements vary, DVFS can be applied. The voltage and frequency can be scaled to match the closest OPP that meets the performance requirement.

When application performance requirements fall between two OPPs, or when a low application performance is required that is below the lowest performance OPP, DPS can be applied to switch to low-power mode.

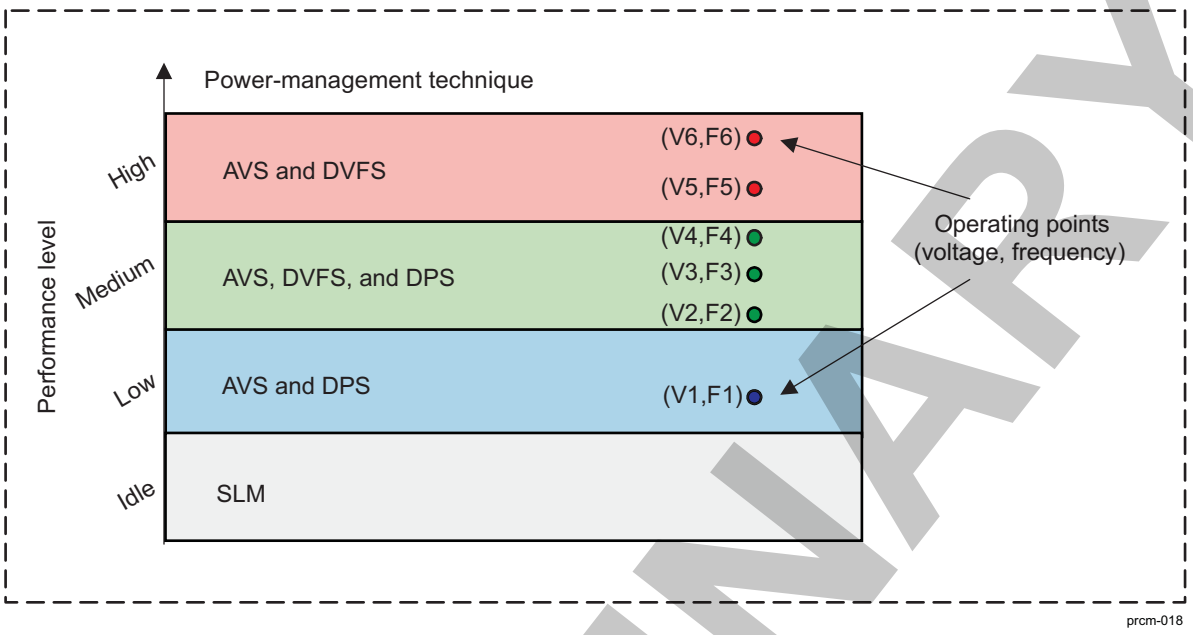
When combining DVFS and DPS, the operating frequency must not be scaled to match the performance requirement without scaling the voltage. Lower operating frequency increases task completion time and reduces idle time. This prevents DPS or reduces its efficiency (DPS becomes more effective as idle time increases). Unless DPS cannot be applied for other reasons, for a given operating point of DVFS the operating frequency must always be set to the maximum allowed at a given voltage. This ensures optimal process completion time and application of DPS.

If DPS cannot be applied in a given context, scaling the frequency while keeping the voltage constant does not save energy; it does, however, reduce peak power consumption. This can have a positive effect on temperature dissipation and battery life.

SLM must be used when no applications are running and performance requirement drops to 0.

NOTE: The OPPs shown in Figure 3-17 are only for indication and clarity of text. They do not correspond to validated OPPs of the device.

Figure 3-17. Performance Level and Applied Power-Management Techniques



3.1.2.7.1 DPS Versus SLM

DPS and SLM are similar concepts: they consist of switching the system between high- and low-power consumption modes. However, their operating timescales differ, principally in the latency allowed for mode transitions.

DPS is generally used in an applicative context (tasks are started). Therefore, mode transitions are related to system performance requirements or the processor load. DPS transition latencies must be small (typically between 10 µs and 100 µs) compared to the time constraints or deadlines of the application so that they do not degrade application performance. DPS requires performance prediction to ensure that transition latencies do not deteriorate device performance to the point that real-time application deadlines are missed or the user experience degrades too much for an interactive application.

SLM is not used in an applicative context (no task started). Mode transitions are related more to system responsiveness, and the transition latencies must be small compared to user sensitivity so that they do not degrade the user experience. For SLM, transition latencies are typically 1–10 ms or more.

DPS and SLM also differ in the type of wake-up event used to exit low-power idle mode. For DPS, wake-up events are application-related (timer, DMA request, peripheral interrupt, etc.); for SLM, wake-up events are user-related (touch screen, key pressed, peripheral connections, etc.).

3.2 PRCM Subsystem Overview

3.2.1 Introduction

The power-management framework of the device significantly reduces dynamic power consumption and static leakage current to extend the life of the battery in the end product. This framework incorporates support for state-of-the-art power-management techniques. It ensures optimal device operation with significantly reduced power consumption. The power-management framework (PMFW) of the device is split over the following modules:

- SCRM: Handles system-level (with one or more devices) clock and reset distribution and management
- PRCM: A logical module composed of the following three physical submodules:
  - PRM: Handles device-level power and reset management. It also handles some clocks in the device. This module always remains on, unless no power is supplied to the device pads.
  - CM_CORE_AON: Handles device-level clock management of the MPU, DSP, and ABE power domains. This module always remains on, unless no power is supplied to the device pads.
  - CM_CORE: Handles device-level clock management of the IVA, CORE, COREAON, display subsystem (DSS), CAM, GPU, L3INIT, and L4_PER domains. This module does not always remain on. It is switched to full retention mode when its power domain (PD_CORE) is in RETENTION state. It is off when no power is supplied to the device pads.
- SMARTREFLEX_MPU, SMARTREFLEX_MM, and SMARTREFLEX_CORE (SmartReflex): Handle AVS features

Together, these modules provide enhanced power-management features with centralized control for the clock, reset, and power-management signals in the device.

The device supports the power-management techniques with the following features:

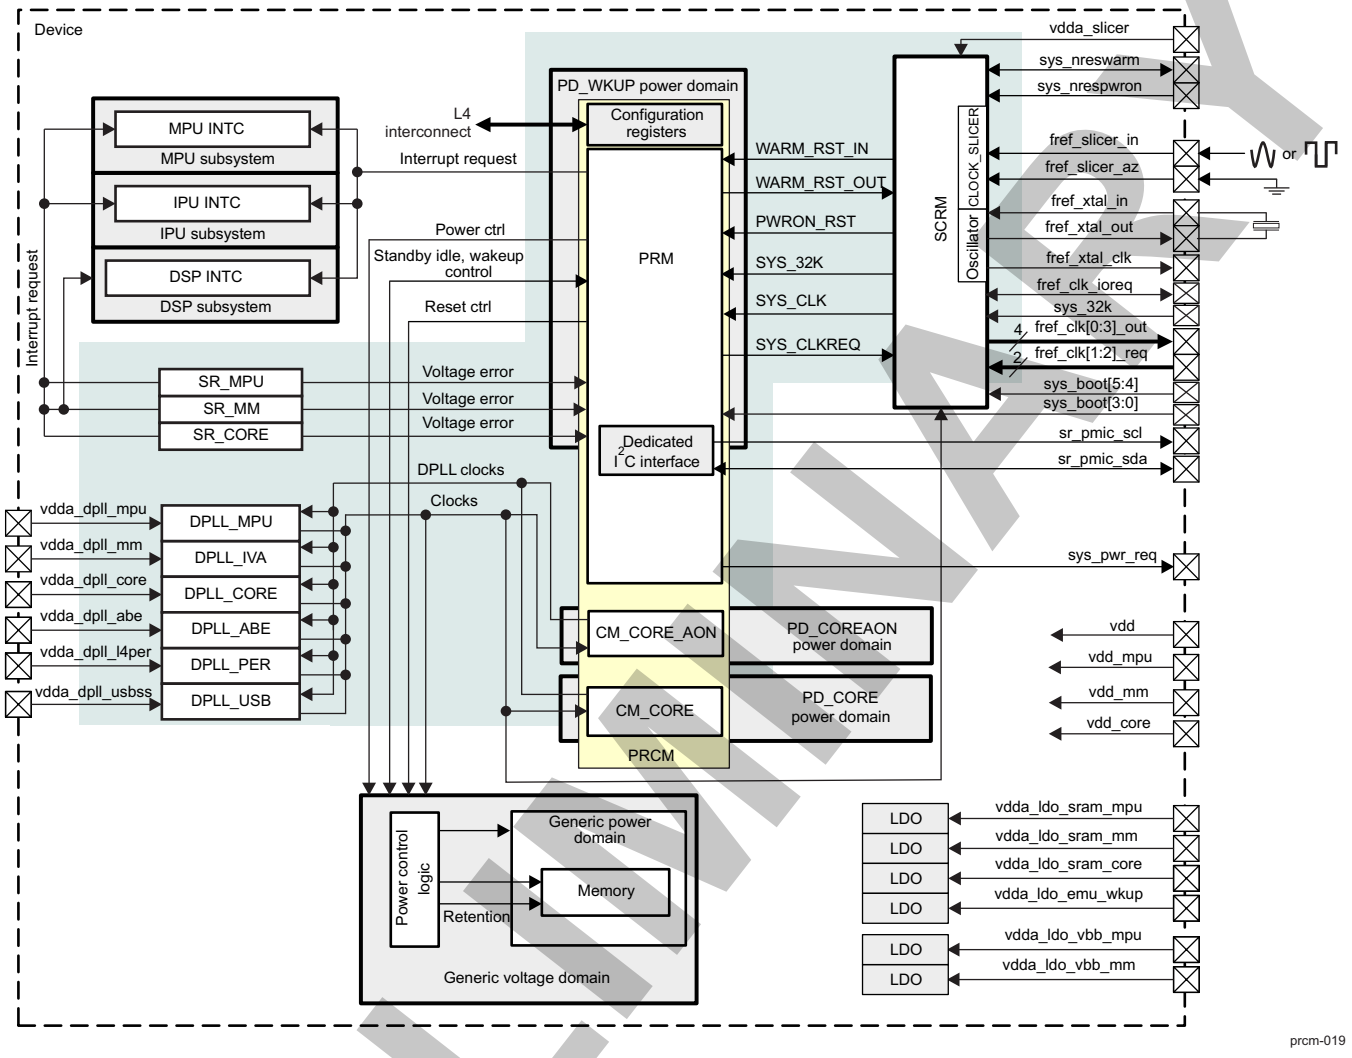
- Partitioning of the device into voltage, power, clock, and reset domains
- Domain isolation that allows any combination of domain ON/OFF states
- Clock tree with selective clock-gating conditions
- Hardware-controlled reset sequencing management
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of the power domains
- Support for hardware-controlled autogating of module clocks
- Memory retention capability for preserving memory contents in low-power sleep mode
- DVFS support for the processor and peripherals
- AVS support for the processor and peripherals, for real-time performance adjustments
- Support for I/O pad configuration in low-power device mode for minimum power consumption when in a low-power power state

The PMFW interfaces with all the components of the device for power, clock, and reset management through associated control signals. It integrates enhanced features to let the device adapt energy consumption dynamically according to changing application and performance requirements. The innovative hardware architecture allows a substantial reduction in leakage current.

The power-management modules are fully configurable through their L4 interface ports.

Figure 3-18 is an overview of the power-management modules and their internal connections with a generic power domain.

Figure 3-18. PMFW Overview



NOTE: The device I/O logic maps the module signals to the different pads of the device. For more information, see the *Common Pad Configuration Controls* and *I/O Cell Specific Pad Group Controls* sections in Section 18.4.8, *Control Module*.

3.2.2 Power-Management Framework Features

The power-management modules:

- Manage independent power domains
- Control scalable logic voltage domains and selectable voltage modes for memory voltage domains
- Handle standby, idle, and wake-up procedures for the modules of the device
- Allow software and partial hardware control
- Monitor and handle wake-up events
- Control system clock and reset input sources
- Manage and distribute clocks and resets with high control granularity
- Handle power-up sequences
- Have debug and emulation features
- Allow adaptive and dynamic voltage scaling with dedicated high-speed (HS) master I^2C interface

- Control RFFs of device modules to support DPS

3.3 PRCM Subsystem Environment

The modules of the PMFW receive the external reset, clock, and power signals. See Figure 3-18.

NOTE: In the remainder of this chapter, power IC refers to a peripheral power source IC that is interfaced with the device. It receives power control commands (voltage scaling and power switching) from the device and provides the necessary voltages and reset signals.

The following sections describe the interfaces for external clock, reset, and power sources.

3.3.1 External Clock Signals

The SCRM module receives a low-frequency clock input, sys_32k, at 32,768-Hz frequency, which will be referenced as a 32-kHz clock. The SCRM module can receive a high-frequency system clock through two possible inputs: fref_slicer_in or fref_xtal_in. The fref_slicer_in input supplies the input clock to an on-chip CLOCK_SLICER, while the fref_xtal_in input can be used as an external crystal connection for internal high-frequency clock generation through an on-chip oscillator.

The SCRM can output four auxiliary clocks, fref_clk[0:3]_out. Output clocks 1 and 2 can be gated or enabled through associated clock request signals, fref_clk[1:2]_req.

Table 3-23 lists the external clock pins, signal names, their direction, associated module, and description of the signals. If the signal is input to the device, the module is the destination module for the signal; if the signal is an output from the device, the module is the source module of the signal.

Table 3-23. External Clock Signals

Pin	Signal	I/O[1]	PMFW Module	Description	Module Reset Value
sys_32k	SYS_32K	I	SCRM	32-kHz clock input (sleep clock)	Z
fref_clk_ioreq	SYSCLK_REQ	I/O	SCRM	System clock request. Input when pins sysboot4 = 0 and sysboot5 = 0 (oscillator mode). Output when pins sysboot4 = 0 and sysboot5 = 1 (CLOCK_SLICER mode).	Z
fref_slicer_in	SLICER_IN	I	SCRM	System clock input to the CLOCK_SLICER. It can be sinusoidal or square input signal.	Z
fref_slicer_az	SLICER_AZ	I	SCRM	Connected to ground at package level	Z
fref_xtal_in	XTAL_IN	I	SCRM	Oscillator drive input from crystal	Z
fref_xtal_out	XTAL_OUT	O	SCRM	Oscillator drive output to crystal	NA
fref_xtal_clk	XTAL_CLK	O	SCRM	Oscillator buffered output	0
fref_clk[1:2]_req	CLK[1:2]_REQ	I	SCRM	Auxiliary clocks request	Z
fref_clk[0:3]_out	CLK[0:3]_OUT	O	SCRM	Auxiliary clocks outputs 0 to 3	For fref_clk0_out value is 0, for all rest value is Z

(1) I = Input; O = Output; I/O = Bidirectional

The signal on the oscillator buffered output (fref_xtal_clk) pin is a direct image of the signal on the fref_xtal_in input pin. The fref_xtal_clk pin provides the oscillator-generated clock to external devices. It is available when the oscillator is active or bypassed.

The XTAL_CLK clock signal is controlled by the CONTROL_CKOBUFFER register in the CTRL_MODULE_WKUP module. The CONTROL_CKOBUFFER register controls the following features of the oscillator output buffer:

- Output buffer enable signal - CONTROL.CONTROL_CKOBUFFER[31] CKOBUFFER_OUT_EN
- Selection of an alternate clock source for the input square signal - CONTROL.CONTROL_CKOBUFFER[30] CKOBUFFER_ALTSEL
- Polarity control for output clock signal - CONTROL.CONTROL_CKOBUFFER[29] CKOBUFFER_POLARITY
- Output clock enable control signal - CONTROL.CONTROL_CKOBUFFER[28] CKOBUFFER_CLK_EN

NOTE: To enable the XTAL_CLK clock signal on the fref_xtal_clk pin, the CONTROL.CONTROL_CKOBUFFER[28] CKOBUFFER_CLK_EN bit must be set.

For information about the CONTROL_CKOBUFFER register, see Section 18.6, *Control Module Register Manual*, in Chapter 18, *Control Module*.

The auxiliary clocks are controlled by the configuration of the SCRM.AUXCLK <clock ID> (where the <clock ID> can be 0 to 4); for example, fref_clk1_out is controlled by the SCRM.AUXCLK1 register. It controls the following features:

- Select the clock-off output polarity
- Source clock input:
  - System clock
  - Clock from DPLL_CORE
  - Clock from DPLL_PER
- Initiate software-generated request
- Software-controlled clock gating
- Divide factor configuration between 1 and 16

NOTE: The SCRM provides a software control to enable and disable each output clock path. To allow the system clock (SYS_CLK) gating, all of the SCRM.AUXCLK<clock ID>[8] ENABLE bits must be cleared.

By default, the SCRM.AUXCLK<clock ID>[8] ENABLE bits are 0x0 after reset.

Software must clear the default reset value in the SCRM.AUXCLK4[8] ENABLE bit.

The bidirectional fref_clk_ioreq pad can be used to manage the external system clock request and auxiliary clock request 0. With this implementation, it is not expected to drive the system clock request externally when the SOC is the clock requester. This implementation requires programming the SCRM accordingly, in case the SOC needs the external system clock request. The programming consists in setting the AUXCLK0[9] DISABLECLK bit to 1 and the AUXCLKREQ0[4:2] MAPPING bit field to 0. Without these settings the SCRM wrongly interprets an external clock request as auxiliary clock request 0.

The SCRM must enable the output buffer of this bidirectional pad as long as it needs to request the external clock source, and the output buffer must be put in high-Z when it no longer needs the system clock source.

If device low-power mode is entered with fref_clk[1:2]_req active, then fref_clk[0:3]_out will be kept running from the system clock (SYS_CLK). LDO_WKUP stays in Active mode.
If fref_clk[1:2]_req is de-asserted while in low-power mode, then fref_clk[0:3]_out will be gated and LDO_WKUP will enter Sleep mode. SYS_CLK can be stopped.
If fref_clk[1:2]_req is re-asserted while in low-power mode, then fref_clk[0:3]_out will stay gated waiting for wake-up event that will trigger transition of LDO_WKUP to Active mode.

3.3.2 External Boot Signals

The PRM receives SYSBOOT[3:0] information from external pins sys_boot[3:0]. They are used to select interfaces or devices for the booting list. For more information, see Chapter 28, *Initialization*, Section 28.2.4.2, *Booting Device Order Selection*.

The SCRM receives SYSBOOT[5:4] information from external pins sys_boot[5:4]. They define the source clock configuration of the device. For more information, see Chapter 28, *Initialization*, Section 28.2.4.1, *Clock Source Selection*.

Table 3-24 lists the external boot pins, signal names, their direction, the associated modules, description, and reset values of the signals. If the signal is input to the device, the module is the destination module for the signal; if the signal is an output from the device, the module is the source module of the signal.

Table 3-24. External Boot Signals

Pin	Signal	I/O [1]	PMWF Module	Description	Module Reset Value
sys_boot0	SYSBOOT0	I	PRM	System boot configuration pin 0: Latched at power-on reset (POR)	Z
sys_boot1	SYSBOOT1	I	PRM	System boot configuration pin 1: Latched at POR	Z
sys_boot2	SYSBOOT2	I	PRM	System boot configuration pin 2: Latched at POR	Z
sys_boot3	SYSBOOT3	I	PRM	System boot configuration pin 3: Latched at POR	Z
sys_boot4	SYSBOOT4	I	SCRM	System boot configuration pin 4: Latched at POR	Z
sys_boot5	SYSBOOT5	I	SCRM	System boot configuration pin 5: Latched at POR	Z

(1) I = Input; O = Output; I/O = bidirectional

3.3.3 External Reset Signals

The SCRM manages two reset signals:

- POR input on the sys_nrespwron pin
- Warm reset on the sys_nreswarm pin

sys_nrespwron is asserted at device power up to reset the full logic in the device.

sys_nreswarm is a bidirectional pin. It can be activated at any time by an external device or an external reset push button action to cause a global warm reset event. The SCRM then holds sys_nreswarm to be driven out and maintained for a limited length of time at the boundary of the device. In this way, the device and its related peripherals are reset together.

The sys_reswarm and sys_nrespwron signals are active low.

Table 3-25 lists the external reset pins, signal names, their direction, associated module, and description of the signals. If the signal is input to the device, the module is the destination module for the signal; if the signal is an output from the device, the module is the source module of the signal.

Table 3-25. External Reset Signals

Pin	Signal	I/O[1]	PMFW Module	Description	Module Reset Value
sys_nreswarm	SYS_WARM_RST	I/O	SCRM	Warm reset input and output	Z
sys_nrespwron	SYS_PWRON_RST_IN	I	SCRM	POR input	Z

(1) I = Input; O = Output; I/O = bidirectional

3.3.4 External Power Control Signals

The power control signals let the PMFW modules control the voltage levels of the device.

The voltage level of the scalable voltage sources in the external power IC can be scaled by sending commands to the power IC through a dedicated I^2C interface in the PRCM module. The clock and data pins for this I^2C interface are sr_pmic_scl and sr_pmic_sda, respectively.

The PRCM module can also command the external power IC to switch the device voltages to off level when the device is switched off, and reactivate them when it wakes up. This is managed through the signal on the sys_pwr_req pin.

Table 3-26 lists the pins, signal names, their direction, associated module, and description for the signals to the external power IC.

Table 3-26. Power Control Interface

Pin	Signal	I/O[1]	PMFW Module	Description	Module Reset Value
sr_pmic_scl	SR_PMIC_SCL	I/O	PRM	The SmartReflex dedicated I^2C interface clock line	1
sr_pmic_sda	SR_PMIC_SDA	I/O	PRM	The SmartReflex dedicated I^2C interface data line	1
sys_pwr_req	PWR_REQ	O	PRM	Power request to the external power IC to switch on or change the device power state	1

(1) I = Input; O = Output; I/O = bidirectional

3.3.5 External Voltage Inputs

Table 3-27 lists the external voltage sources related to the PRCM module.

NOTE: Table 3-27 lists only the voltage sources that are directly managed by the PRCM module or received by parts of the PRCM module (for example, DPLLs, LDOs, etc.). It does not give the device voltage sources not directly associated with the PRCM module.

Table 3-27. Voltage Sources

Pin	Signal	Managed by the PRCM	Description
vdd	VDD_CORE_L	Yes (AVS and DVFS)	Supplies VDD_CORE_L logic voltage domain
vdd_mpu	VDD_MPU_L	Yes (AVS and DVFS)	Supplies VDD_MPU_L logic voltage domain
vdd_mm	VDD_MM_L	Yes (AVS and DVFS)	Supplies VDD_MM_L logic voltage domain (that is, DSP and IVA)
vdda_dpll_core	VDDA_DPLL_CORE	No (fixed)	DPLL_CORE analog power supply
vdda_dpll_mpu	VDDA_DPLL_MPU	No (fixed)	DPLL_MPU analog power supply
vdda_dpll_mm	VDDA_DPLL_IVA	No (fixed)	DPLL_IVA analog power supply
vdda_dpll_l4per	VDDA_DPLL_PER	No (fixed)	DPLL_PER analog power supply
vdda_dpll_abe	VDDA_DPLL_ABE	No (fixed)	DPLL_ABE analog power supply
vdda_dpll_usbss	VDDA_DPLL_USB	No (fixed)	DPLL_USB analog power supply
vdda_slicer	VDDA_SLICER	No (fixed)	CLOCK_SLICER power supply
vdd_osc	VDD_OSC	No (fixed)	Clock oscillator core power supply
vdda_ldo_sram_mpu	VDDA_LDO_SRAM_MPU	No	Supplies SLDO_MPU
vdda_ldo_sram_mm	VDDA_LDO_SRAM_MM	No	Supplies SLDO_MM for MM SRAM
vdda_ldo_sram_core	VDDA_LDO_SRAM_CORE	No	Supplies SLDO_CORE for CORE SRAM
vdda_ldo_emu_wkup	VDDA_LDO_EMU_WKUP	No	Supplies LDO_WKUP for WAKEUP/EMU logic
vdda_bdgp	VDDA_BDGP	No (fixed)	BANDGAPs supply input
vdda_ldo_vbb_mpu	VDDA_VBBLDO_MPU	No	MPU VBB LDO supply input
vdda_ldo_vbb_mm	VDDA_VBBLDO_MM	No	MM VBB LDO supply input

3.4 PRCM Subsystem Integration

The internal configuration registers of the power-management modules can be accessed for configuration and control through their respective L4_WKUP interconnect. In addition to the L4 interconnect, the internal module interface contains the following interfaces and signals:

- A set of signals for idle/wake-up control for each module
- Clocks and reset signals for the modules
- Power control signals (switches and memories) to the power domains
- Interrupts to the MPU, IPU, and DSP INTCs
- Voltage error commands from the SmartReflex modules to the external power IC
- Phase-locked loop (PLL) control commands for recalibration and bypass of the digital phase-locked loops (DPLLs)

Figure 3-18 shows details of the control interface to a generic power domain.

3.4.1 Device Power-Management Layout

The PMFW sees the device split into voltage domains, power domains, and clock domains. Table 3-28 provides the device-level view with module association to the clock, power, and voltage domains.

Table 3-28. PMFW Device-Level Layout

Voltage Domain	Power Domain	Clock Domain	Module

3.4.2 Power-Management Scheme, Reset, and Interrupt Requests

3.4.2.1 Power Domain

Table 3-29 lists the PMFW modules and their associated power domains.

Table 3-29. PMFW Module Power Domains

PMFW Module	Power Domain
SCRM	PD_WKUPAON
PRM	PD_WKUPAON
CM_CORE_AON	PD_COREAON
CM_CORE	PD_CORE
SMARTREFLEX_MPU	PD_COREAON
SMARTREFLEX_MM	PD_COREAON
SMARTREFLEX_CORE	PD_COREAON

The PRM part of the PRCM module is in the PD_WKUPAON power domain, which is continuously active. It is composed of the logic that must be permanently supplied to manage domain power-state transitions and detect wake-up events.

The CM_CORE_AON part of the PRCM module is in the PD_COREAON power domain, which is an always-on power domain, while the CM_CORE part of the PRCM module is in the PD_CORE power domain, which can be activated and deactivated according to the requirements of the executing applications.

3.4.2.2 Resets

The PMFW modules are reset by independent reset signals (see Table 3-30).

Table 3-30. PMFW Module Reset Signals

PMFW Module	Reset Signal
SCRM	SYS_PWRON_RST_IN
PRM	SYS_PWRON_RST_IN
CM_CORE_AON	CM_CORE_AON_PWRON_RST
	CM_CORE_AON_RST
CM_CORE	CM_CORE_PWRON_RET_RST
	CM_CORE_RET_RST
SMARTREFLEX_MPU	COREAON_RST
SMARTREFLEX_MM	COREAON_RST
SMARTREFLEX_CORE	COREAON_RST

NOTE: For more information about the reset trigger sources and assertion conditions, see Section 3.5.3, *Reset Sources*.

3.4.2.3 Interrupt Requests

The PMFW modules can generate the interrupts listed in Table 3-31.

Table 3-31. PMFW Module Interrupts

Source PMFW Module	Source Signal Name	Destination INTC	Destination Signal Name
PRCM	PRM_MPU_IRQ	INTC_MPU	MPU_IRQ_11
PRCM	PRM_IRQ_IPU	INTC_IPU	IPU_IRQ_47
PRCM	PRM_IRQ_DSP	INTC_DSP	DSP_IRQ_57
SMARTREFLEX_MM	SMARTREFLEX_MM_IRQ	INTC_MPU	MPU_IRQ_102
SMARTREFLEX_MPU	SMARTREFLEX_MPU_IRQ	INTC_MPU	MPU_IRQ_18
SMARTREFLEX_CORE	SMARTREFLEX_CORE_IRQ	INTC_MPU or INTC_IPU	MPU_IRQ_19 or IPU_IRQ_48

3.5 Reset Management Functional Description

3.5.1 Overview

In the device, the reset scheme is managed by the following modules:

- SCRM: System-level reset management. It provides correct reset routing and sequencing when one or more devices are stacked together in the same package.
- PRM: Device-level reset management

3.5.1.1 SCRM Reset Management Functional Description

The SCRM handles the device power-on and warm reset pads, sys_nrespwron and sys_nreswarm resets. The SCRM:

- Extends the reset duration beyond the pad reset release
- Routes the device pad resets to the reset manager in the PRM module

The SCRM is functionally sensitive to the device POR. However, some of the register bits of the SCRM registers are reset when a device warm reset occurs.

3.5.1.1.1 Power-On Reset

The SCRM receives the device POR on the sys_nrespwron reset pad of the device. It extends the duration of the POR to the device PRM module until at least a stable 32-kHz clock can be provided to it. The 32-kHz clock version of the device is active once the SCRM releases the internal POR. The SCRM automatically deasserts the reset.

The SCRM automatically requests the system clock under a POR condition. This mechanism is functionally active on the 32-kHz clock.

The POR can also be asserted through software control. Software must enable the software reset assertion feature by setting the SCRM.EXTPWRONRSTCTRL[0] ENABLE bit and then by setting the SCRM.EXTPWRONRSTCTRL[1] PWRONRST bit to assert the reset.

3.5.1.1.2 Warm Reset

The device warm reset can be received from an external source through the sys_nreswarm warm reset pad or from the device PRM module as a result of an internal event.

The SCRM extends the duration of the device pad warm reset to the device PRM module.

The SCRM routes a warm reset source (that is, sys_nreswarm pad/PRM module) to a warm reset destination (that is, the PRM module).

The status of a warm reset source for each destination is logged in the corresponding SCRM.EXTWARMRSTST_REG[0] EXTWARMRSTST bit, when the destination reset is released. This is done at the 32-kHz clock.

Software must clear the reset status bit.

When one source of any global warm reset is detected, PRCM logic insures that all voltage domains have transitioned to ON state before starting warm reset sequence.

3.5.1.2 PRM Reset Management Functional Description

The PRM module manages the resets to all power domains inside the device.

NOTE: The PRM module has no knowledge or control over resets generated locally within a module (for example, through the <Module name>_SYSCONFIG[x] SOFTRESET configuration register bit). A software reset has the same effect on the module logic as a hardware reset.

All PRM reset outputs are asynchronously asserted, while the deassertion is synchronous to the SYS_CLK clock. The reset managers in PRM use this clock for internal stall (delay) counter to delay deassertion of reset when the input reset source is deasserted.

In each power domain one or more reset domains are defined. A reset domain is defined by a unique reset signal that originates from the reset manager and is connected to one or more modules of the device. All the connected modules of the reset domain are reset simultaneously when the reset signal is asserted. Independent control of these reset domains allows sequencing of the release of resets and ensures a safe reset of the entire power domain.

NOTE: All internal reset signals are active low, including the DPLL reset signals.

3.5.2 General Characteristics of Reset Signals

Reset signals can be categorized based on four criteria:

- Scope: Global or local reset
- Occurrence: Cold or warm reset
- Source type: Software-controlled or hardware-triggered reset
- Retention type: Retention reset or nonretention reset

3.5.2.1 Scope

A reset signal can be categorized according to its scope (the area of the device affected by the reset):

- Global reset: Affects the entire logic of the device; all modules are reset. Generally, occurs when the device powers up or an abnormal operation is detected.
- Local reset: Affects one power domain, reset domain, or module. Generally, when a power domain transitions from a switched-off state to an active state, or when a software-reset control bit for a domain is set, only the group of modules within that domain is affected.

3.5.2.2 Occurrence

A reset signal can be categorized depending on when the reset occurs:

- Cold reset: Occurs only on device power up or in certain emulation modes. The cold reset is a global reset that affects every module in the device. It usually corresponds to the initial POR.
- Warm reset: Occurs when the device is in normal operating state. A module can use a warm reset to reset a subset of its logic. This is often done to speed up reset recovery time; that is, the time to transition to a safe operating state, compared to the time required upon receipt of a cold reset. Warm reset events include software-triggered reset per power domain, watchdog time-out, externally triggered and emulation initiated.

Modules that behave differently in cold reset and warm reset have two reset signals: RST and PWRON_RST. These reset signals reconstruct warm reset and cold reset in modules that require them.

The following modules are reset upon global cold reset events and not upon global warm reset events:

- All DPLLs associated with the PRCM module
- EMIF
- Control module: All the module instances in the PD_WKUPAON power domain

NOTE: For information about the PRCM module registers affected by the global warm reset, see the register description in Section 3.11, *PRCM Register Manual*.

3.5.2.3 Source Type

A reset can be categorized depending on whether it is software-controlled or hardware-triggered:

- Software reset: Triggered by setting a bit in a configuration register of the PRCM module

- Hardware reset: Triggered by a signal from a hardware module inside or outside the PRCM module

3.5.2.4 Retention Type

The power domain manager in PRM controls the assertion of two types of local cold reset sources, retention and nonretention reset. They are identified by the naming convention <PowerDomain>_DOM_RET_RST and <PowerDomain>_DOM_RST, respectively.

Upon transitioning a power domain to the ON-ACTIVE power state from the OFF power state:

- Retention type reset source is always asserted.
- Nonretention type reset source is always asserted.

Upon transitioning a power domain to the ON-ACTIVE power state from a switched-off state:

- Retention type reset source is never asserted.
- Nonretention type reset source is optionally asserted. The software-selectable option enables the PRM to support the CSWRET retention mechanism. Nonretention type reset source is not asserted if the power domain state transitions from the CSWR-RETENTION state.

3.5.3 Reset Sources

The reset sources triggering the reset managers in the PRM are described in this section.

3.5.3.1 Global Reset Sources

Table 3-32 lists the global reset sources of the device. The global reset source signals received by the reset manager trigger the reset of all the device modules. For all hardware reset signals, the source of the reset is identified; for the software reset signals, the bit triggering the reset is identified.

Table 3-32. Global Reset Sources

Type[(1)]	Name	Source/Control	Description
H/C	SYS_PWRON_RST	Received from the SCRM through input pin or through software control	The entire device is reset on power up.
H/W	SYS_WARMIN_RST	Received from the SCRM through input pin or through software control	External hardware warm reset
S/C	GLOBAL_COLD_SW_RST	PRCM module.PRM_RSTCTRL[1] RST_GLOBAL_COLD_SW	Global software cold reset
S/W	GLOBAL_WARM_SW_RST	PRCM module.PRM_RSTCTRL[0] RST_GLOBAL_WARM_SW	Global software warm reset
H/W	VDD_CORE_VOLT_MGR_RST	PRCM module	Asserted by the voltage manager FSMs when no response from the power IC is received during wake-up transition from retention or off mode
H/W	VDD_MM_VOLT_MGR_RST	PRCM module	
H/W	VDD_MPU_VOLT_MGR_RST	PRCM module	
H/W	TSHUT_MPU_RST	MPU voltage domain thermal sensor	Asserted when measured temperature is greater than shutdown temperature threshold
H/W	TSHUT_MM_RST	MM voltage domain thermal sensor	
H/W	TSHUT_CORE_RST	Device thermal sensor, placed close to the ISS, DSP, and IVA	
H/W	ICEPICK_RST	ICEPick™ module	It is used only in emulation mode.
H/W	ICEPICKPOR_RST	ICEPick module	It is used only in emulation mode.
H/W	MPU_WDT_RST	WD_TIMER2 or MPU subsystem	It is triggered by a time-out event.

(1) H = Hardware reset, S = Software reset, C = Cold reset, W = Warm reset

3.5.3.2 Local Reset Sources

In addition to the global reset sources the device can have a number of local reset sources for each power domain. The local reset sources can be cold or warm reset sources. They can be software-controlled or hardware-triggered. Table 3-33 identifies the possible types of hardware-triggered local cold reset sources. Some power domains can support one or both of these local cold reset sources. The table does not list the software-triggered local warm reset sources that are listed in the reset management section of the respective power domains. A local reset source signal received by the reset manager resets only a specific part of the device (for example, some modules/subsystems within the power domain).

Table 3-33. Local Reset Sources

Type[(1)]	Name	Source/Control	Description
H/C	<Power domain>_RET_RST	PRCM	Asserted only for a power domain state transition to the ON-ACTIVE state
H/C	<Power domain>_RST	PRCM	Asserted for any power domain state transition to the ON-ACTIVE state

(1) H = Hardware reset, C = Cold reset

3.5.4 Reset Domains

A power domain can receive power-on reset (PWRON_RST) and/or normal reset (RST) signals. These signals reset nonretention logic and behave as follows:

- On any global or local cold reset, RST and PWRON_RST are asserted.
- On any global or local warm reset, only RST is asserted.

A power domain can receive two additional retention logic reset signals: power-on retention reset (PWRON_RET_RST) and/or retention reset (RET_RST). These signals behave as follows:

- On any global cold reset or wakeup from an off (no power supply) state to the ON-ACTIVE state, RET_RST and PWRON_RET_RST are asserted.
- On any global warm reset, only RET_RST is asserted.
- On wakeup from RETENTION state, these signals are not asserted.

This section discusses the trigger sources and attributes for all reset domains of the device. For an explanation of each reset trigger source of the device, see Section 3.5.3, *Reset Sources.*

Table 3-34 identifies the associated power and rest domains for each module.

Table 3-34. Modules, Power Domains, and Reset Domains Association

DSP_RST	WKUPAON_GCLK	ResetTime2 (2)	DSP_GCLK clock is not active and the subsystem is reset.
DSP_PWRON_RST	WKUPAON_GCLK	ResetTime2 (2)	DSP_GCLK clock is not active, RM_DSP_RSTCTRL[1] RST_DSP_MMU_CACHE bit is cleared, and automatic restore is complete.

(2) ResetTime2 is set in the PRM_RSTTIME[14:10] RSTTIME2 bit field.

Table 3-36. Reset Domains Attributes (continued)

Reset Domain	RM Clock	RM Clock Count	Release Stall Conditions
DSP_RET_RST	WKUPAON_GCLK	ResetTime2[3]	DSP_GCLK clock is not active and the subsystem is reset.
DSP_SYS_RST	WKUPAON_GCLK	ResetTime2[3]	DSP_GCLK clock is not active and the subsystem is reset.
WKUPAON_PWRON_RST	WKUPAON_GCLK	0x0	None
WKUPAON_RST	WKUPAON_GCLK	0x0	None
WKUPAON_SYS_PWRON_RST	WKUPAON_GCLK	0x0	None
PRM_PWRON_RST	WKUPAON_GCLK	0x0	WKUPAON_ICLK clock is not active.
PRM_RST	WKUPAON_GCLK	0x0	WKUPAON_ICLK clock is not active.
LPRM_PWRON_RST	WKUPAON_GCLK	0x0	WKUPAON_ICLK clock is not active.
LPRM_RST	WKUPAON_GCLK	0x0	WKUPAON_ICLK clock is not active.

(3) ResetTime2 is set in the PRM_RSTTIME[14:10] RSTTIME2 bit field.

NOTE: WKUPAON_SYS_PWRON_RST is connected directly to the SYS_PWRON_RST source reset.

3.5.5 Reset Logging

A reset of the device is logged in two ways:

1. Dedicated registers in the PRCM module (the RM_<Power domain>_RSTST) log the reset sources to the power domain.
2. The control module logs the device reset activity in dedicated registers.

3.5.5.1 PRCM Module Reset Logging Mechanism

The reset status registers RM_<power domain>_RSTST and PRM_RSTST are reset asynchronously on assertion of a global cold reset. However, a reset status bit is always logged when the reset is released to the domain.

For this reason, after the assertion of a global cold reset, the reset status register is cleared to 0. When the domain reset is released, the register bit to log the global cold reset (the PRM_RSTST[0] GLOBAL_COLD_RST bit) is updated to 1. For the same reason, the reset status register of domains released from reset by software is updated only when software releases the domain reset.

The assertion of a global cold reset prevents logging any other source of reset until after the release of the domain reset. This is valid in the following situations:

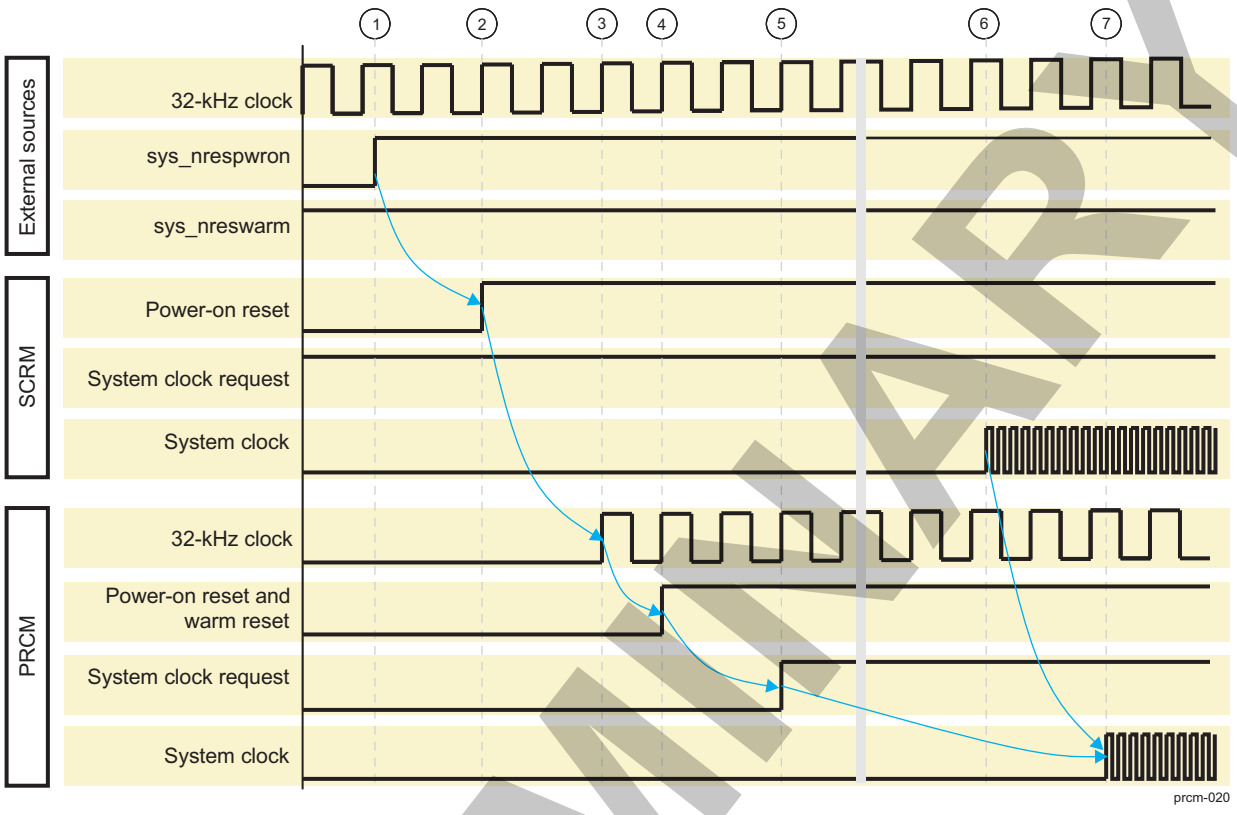
- A source of reset other than global cold reset is asserted before, during, or after the active period of a global cold source of reset and before the release of the domain reset signal.
- A source of reset other than global cold reset is asserted and then released, but a global cold reset source is asserted before the release of the domain reset signal.

3.5.6 Reset Sequences

3.5.6.1 SCRM Power-On Reset Sequence

Figure 3-19 shows the power-on reset sequence as the reset is received by the SCRM, and the resulting interaction between the SCRM and PRCM modules. Figure 3-20 shows the power-on reset sequence within the PRCM module.

Figure 3-19. SCRM Power-On Reset Sequence



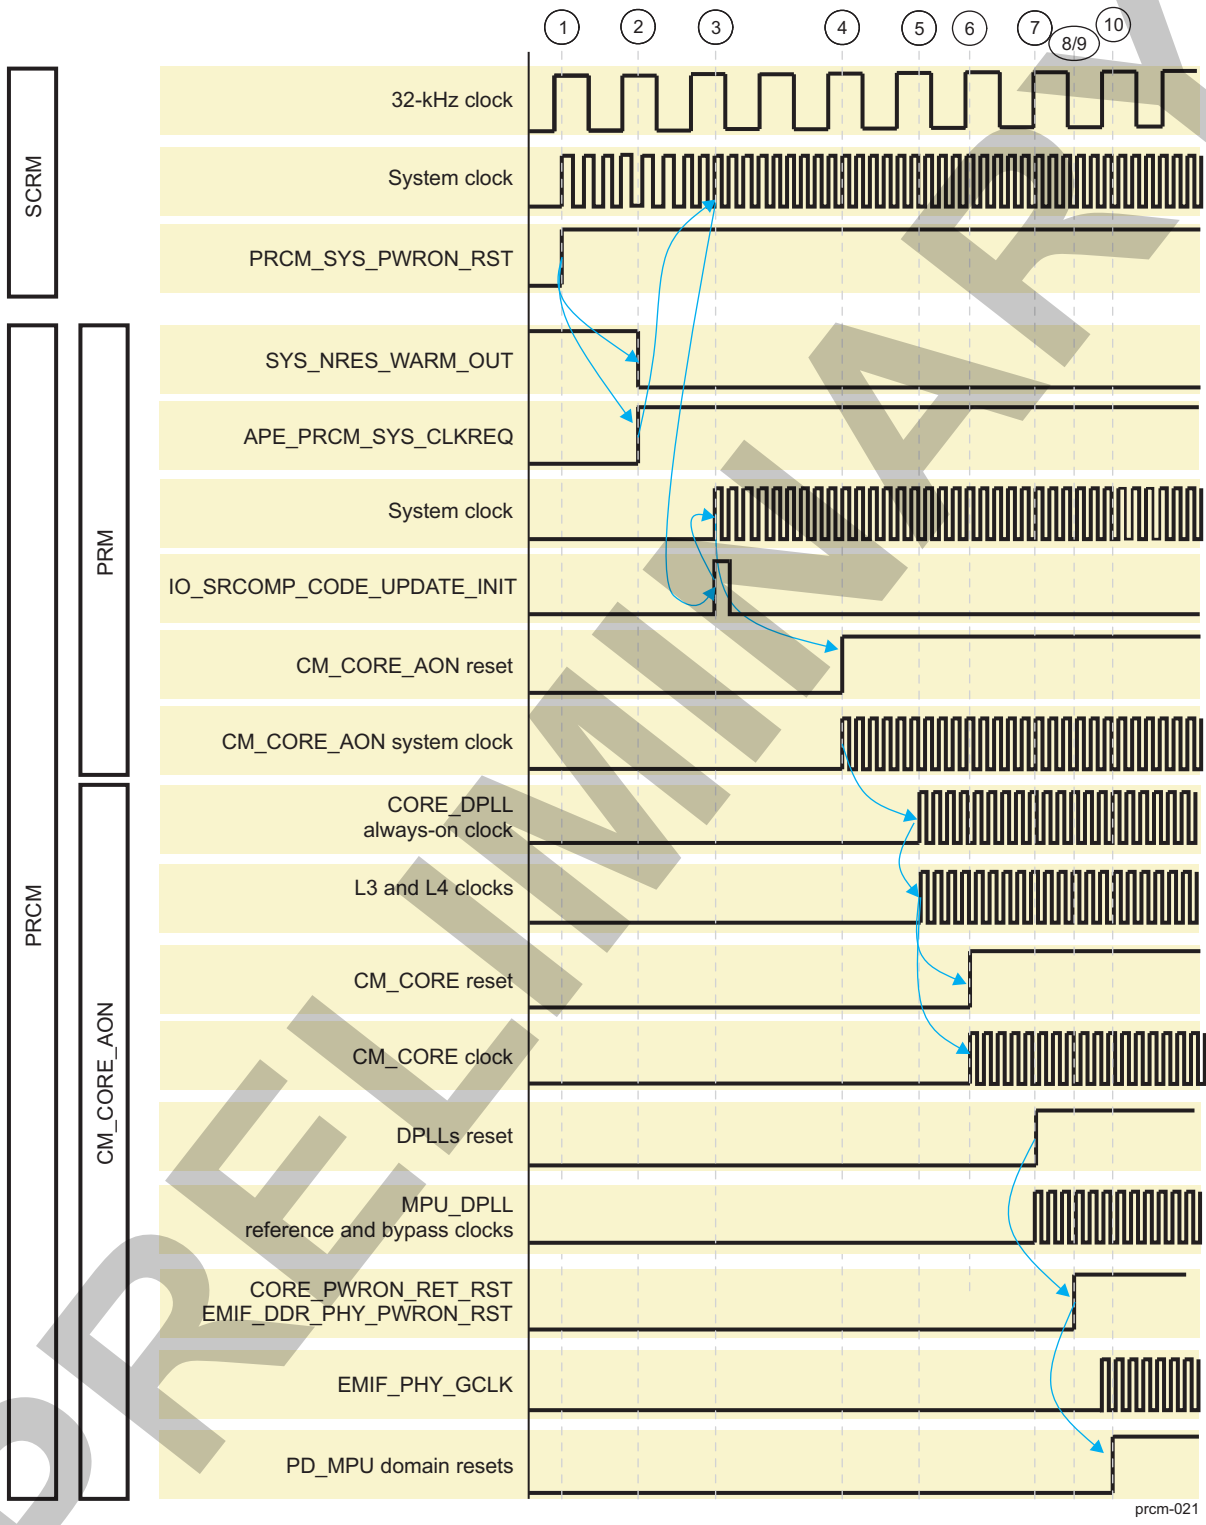
The power-on reset sequence is:

1. The power-on reset pad is released from reset when the 32-kHz clock is already active.
2. SCRM releases its internal power-on reset clocked at the 32-kHz clock.
3. SCRM delays the release of the PRCM module resets to account for the stabilization time of the system clock source. It routes the 32-kHz clock to the PRCM module.
4. SCRM releases the PRCM module from reset (both power-on and warm reset).
5. The PRCM module asserts a system clock request to the SCRM.
6. Once the system clock setup-time counter overflows, the internal system clock version of SCRM is stable.
7. SCRM ungates the system clock to the PRCM module.

3.5.6.2 PRCM Module Power-On Reset Sequence

Figure 3-20 shows the power-on reset sequence.

Figure 3-20. PRCM Module Power-On Reset Sequence



The assumptions are:

- All the logic and memory voltage sources are at their nominal voltage levels.
- The SCRM module is supplying the 32-kHz clock to the PRCM module and the clock is stable.
- The power-on reset (SYS_PWRON_RST_IN) has been released by the external power IC.

The power-on reset sequence is:

1. The SCRM releases a global power-on reset to the PRCM module (that is, PRCM_SYS_PWRON_RST). As a result, the PRCM module starts the Power-On Reset sequence.
2. The PRCM module releases SYS_NRES_WARM_OUT to the SCRM (only after all voltage domains are ramped up) after some 32-kHz clock cycles, and it also asserts APE_PRCM_SYS_CLKREQ to the SCRM module to request the system clock.
3. The SCRM provides the system clock to the PRCM module when the system clock source is stable. After LDOs stabilization, PRM generates IO_SRCOMP_CODE_UPDATE_INIT signal (one cycle pulse) used by the slew rate compensation cells to load default compensation code defined in CTRL_MODULE_CORE.
4. The PRM logic is then released from reset. The PRM provides CM_CORE_AON with a version of the system clock and releases CM_CORE_AON from reset.
5. CM_CORE_AON starts the reference clock (and also the bypass clock) of the CORE DPLL. In turn, the CORE DPLL, which is configured in bypass mode, generates the L3 clock (running at the system clock frequency at this stage). Now the CM_CORE_AON logic is fully operational: CM_CORE_AON logic is released from reset and the L3 clock is running.
6. CM_CORE_AON starts the L4 clock version for CM_CORE_AON, and the PRM deasserts the reset of CM_CORE.
7. The DPLLs are released from reset. The DPLLs can be released from reset before the L3 clock is running. The DPLL being under reset does not prevent the output clock from running. CM_CORE_AON starts the reference and bypass clocks to DPLL_MPU.
8. The CORE is released from reset, provided the L3 clock is running. The EMIF comes out of reset as soon as the CORE power domain power on retention reset (CORE_PWRON_RET_RST) (see Table 3-36) is released by the PRCM module. The PRCM module also releases EMIF_DDR_PHY_PWRON_RST. The EMIF_PHY_GCLK clock is not running at this point; hence, all the PHYs are asynchronously reset at the same time. The EMIF_PHY_GCLK clock is started later.
9. The PRCM module releases the IDLE request signal to the EMIF module once the EMIF functional clock is enabled. The EMIF then acknowledges the deassertion of IDLE request and becomes active.
10. The MPU subsystem is released from reset provided its clock is active and the L3 interconnect is operational.

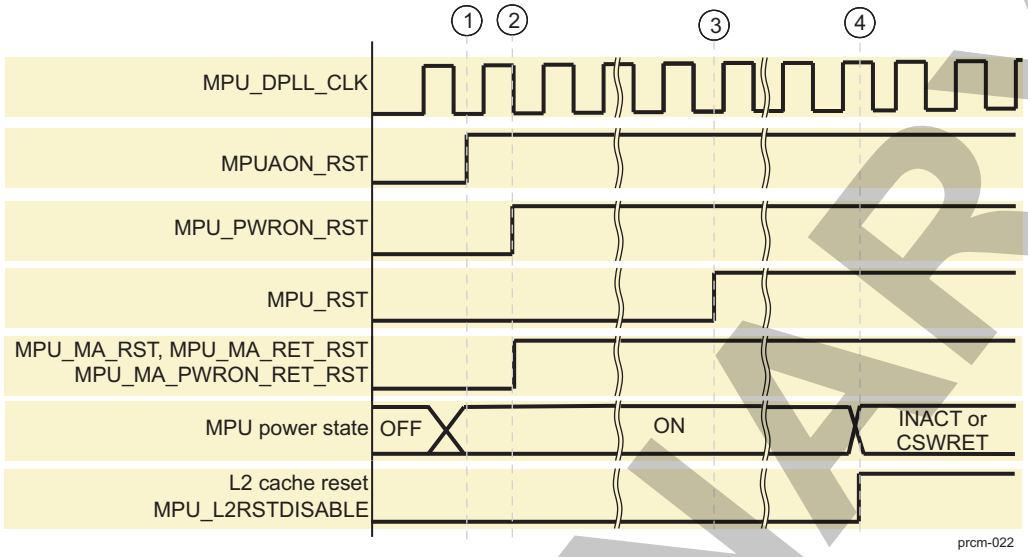
NOTE:

- The PD_DSP and PD_IVA power domains are held under reset after power up by the assertion of software source of reset.
- After the power-up sequence completes, software must reprogram the value of the PRM_RSTTIME[9:0] RSTTIME1 bit field to ensure that in case of a new warm reset assertion, generated global warm reset is extended for a sufficient time (defined by the external power IC requirements).

3.5.6.3 MPU Subsystem Power-On Reset Sequence

Figure 3-21 shows the POR sequence of the MPU subsystem.

Figure 3-21. MPU Power-On Reset Sequence



The assumptions after power-on reset assertion are:

- The PRCM module provides the DPLL_MPU reference clock and the bypass clock.
- The PRCM module has released DPLL_MPU reset and DPLL_MPU is in bypass mode providing the clock (that is, bypass clock) to all the modules in the MPU subsystem.

The POR sequence is:

1. The PRCM module releases asynchronously in PD_MPUAON the MPUAON_RST reset to the INTC_MPU module in the MPU subsystem.
2. The PRCM module releases in PD_MPU the MPU_PWRON_RST (only after MPU_DPLL_CLK is active) to the MPU subsystem and waits until the subsystem completes its internal reset sequence. MA_MPU (Memory-adapter) dedicated reset signals (MPU_MA_RST, MPU_MA_RET_RST, and MPU_MA_PWRON_RET_RST) are released when MPU_DPLL_CLK is running (at the same time as MPU_PWRON_RST).
3. When the MPU subsystem internal reset sequence completes, the PRCM module releases in PD_MPU the MPU_RST signal and the MPU starts booting.
4. The PRCM module drives the MPU_L2RSTDISABLE signal low a minimum of 32 SYS_CLK cycles after MPU_RST is deasserted. The PRCM module keeps the MPU_L2RSTDISABLE signal low until the next power domain transition.

NOTE:

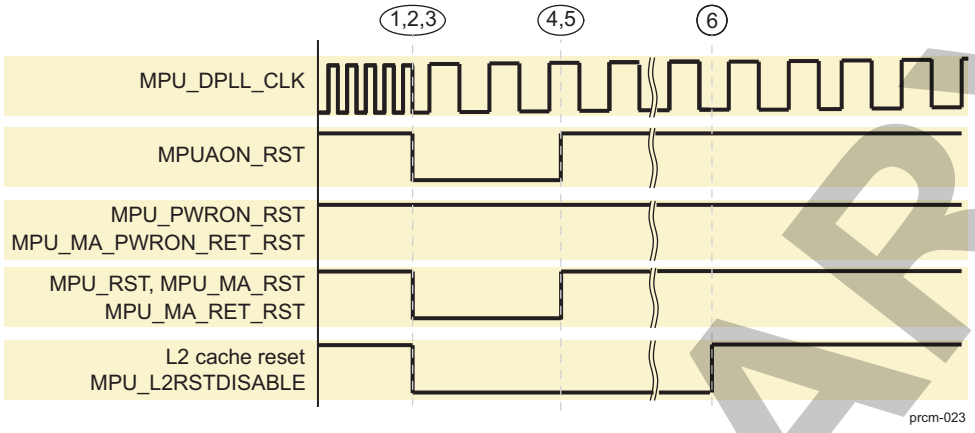
- The reset to the L2 cache memory (MPU_L2RSTDISABLE) in the MPU subsystem is asserted during initial POR (that is, when the PD_MPU wakes up from OFF state). It is also asserted during local or global warm reset. However, it is not asserted when the PD_MPU wakes up from RETENTION state (that is, when the logic is OFF and L2 memory is in RETENTION state). This ensures that the L2 cache is retained on wakeup.
- The L1 cache memory in the MPU subsystem is not retained on PD_MPU wakeup.

For more information about power management in the MPU subsystem, see Section 4.3.7, *MPU Subsystem Power Management*, in Chapter 4, *Dual Cortex-A15 MPU Subsystem*,

3.5.6.4 MPU Subsystem Warm Reset Sequence

Figure 3-22 shows the warm reset sequence of the MPU subsystem.

Figure 3-22. MPU Warm Reset Sequence



The assumptions are:

- The DPLL_MPU is locked and is providing the clock to the MPU subsystem.
- A global or local warm reset to the MPU subsystem is asserted.

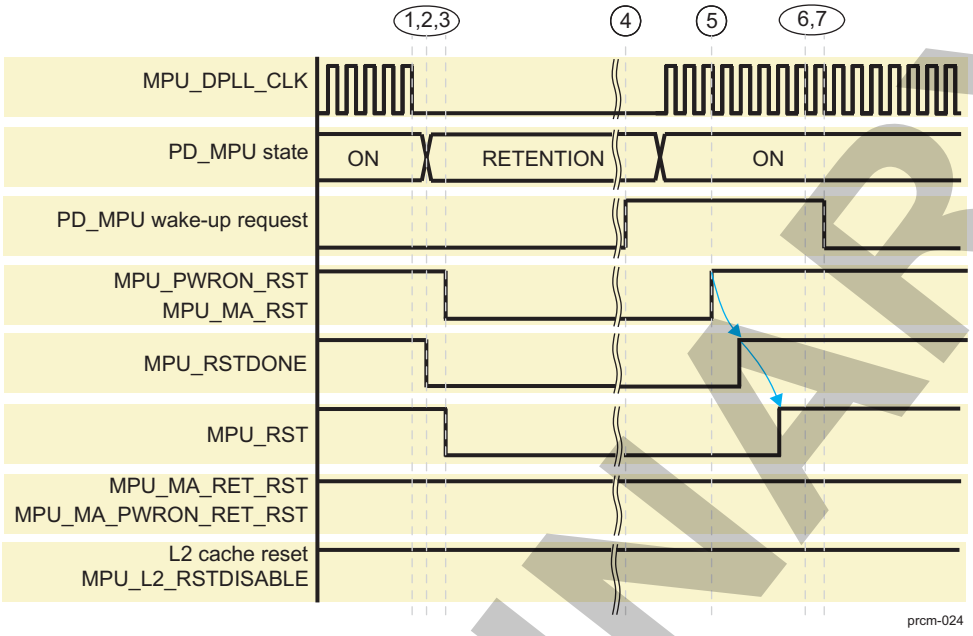
The warm reset sequence is:

1. The PRCM module asserts in PD_MPUAON the MPUAON_RST reset to the INTC_MPU module in the MPU subsystem. The MPU DPLL is locked.
2. The PRCM module asserts in PD_MPU the MPU_RST reset to the MPU subsystem and also asserts MPU_MA_RST and MPU_MA_RET_RST resets to the MA_MPU module.
3. The PRCM module resets the L2 cache memory in the MPU subsystem by asserting its reset.
4. The PRCM module releases the MPUAON_RST reset to the INTC_MPU module. The MPU DPLL is in bypass mode.
5. The PRCM module releases MPU_RST, MPU_MA_RST, and MPU_MA_RET_RST only after DPLL_MPU is in bypass mode and MPU_DPLL_CLK is stable and active.
6. The PRCM module drives the MPU_L2RSTDISABLE signal low a minimum of 32 SYS_CLK cycles after MPU_RST is deasserted. The PRCM keeps the MPU_L2RSTDISABLE signal low until the next power domain transition.

3.5.6.5 MPU Subsystem Reset Sequence on Sleep and Wake-Up Transitions From RETENTION and OFF States

Figure 3-23 shows the sleep and wake-up transitions reset sequence from the RETENTION and off (no power supply) states of the MPU subsystem.

Figure 3-23. MPU Reset Sequence on Sleep and Wake-Up Transition



The assumption is:

- The DPLL_MPU is locked and is providing the clock to the MPU subsystem.

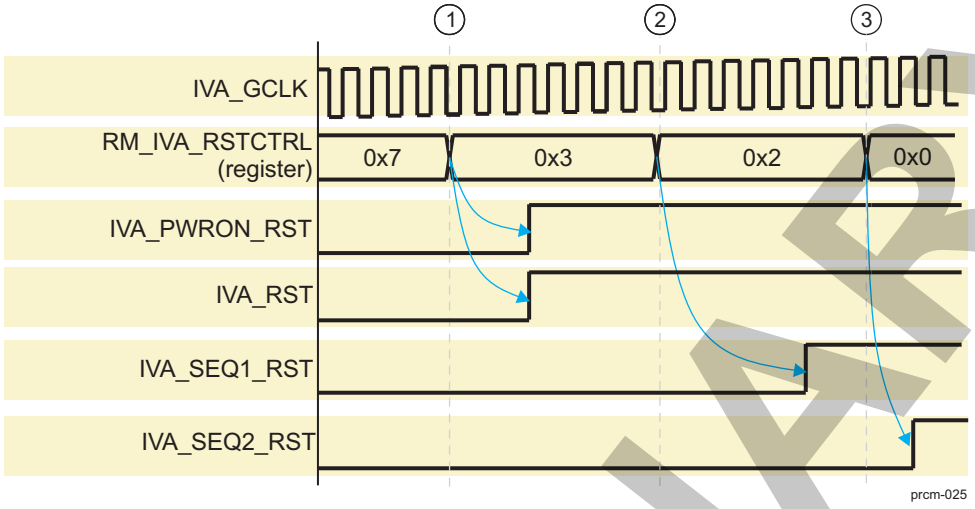
The sleep and wake-up transitions reset sequence is:

1. The PRCM module gates MPU_DPLL_CLK to the MPU subsystem.
2. The PRCM module switches PD_MPU to RETENTION state.
3. The PRCM module asserts MPU_PWRON_RST and MPU_RST resets to the MPU subsystem, and asserts MPU_MA_RST to the MA_MPU module. The entire logic in the PD_MPU is held in reset. The reset to the L2 cache memory in the MPU subsystem is not asserted if the logic in PD_MPU is held in reset.
4. The PRCM module resets the L2 cache memory in the MPU subsystem by asserting its reset.
5. The PRCM module releases MPU_RST only after the DPLL_MPU is in bypass mode and the MPU_DPLL_CLK is stable and active. The PRCM deasserts the MPU_PWRON_RST, MPU_MA_RST. When PRCM receives active MPU_RSTDONE signal from MPU, it de-asserts MPU_RST.
6. During the wakeup from RET state, the MPU_L2RSTDISABLE signal must be maintained at active high so the L2 cache will not be reset when the MPU is reset.

3.5.6.6 IVA Subsystem Power-On Reset Sequence

Figure 3-24 shows the power-on reset sequence of the IVA subsystem.

Figure 3-24. IVA Power-On Reset Sequence



The power-on reset to IVA is applied when PD_IVA is powered. The assumptions after power-on reset assertion are:

- The PRCM module provides the IVA_GCLK functional clock to the IVA subsystem, and it has been enabled by MPU software control.

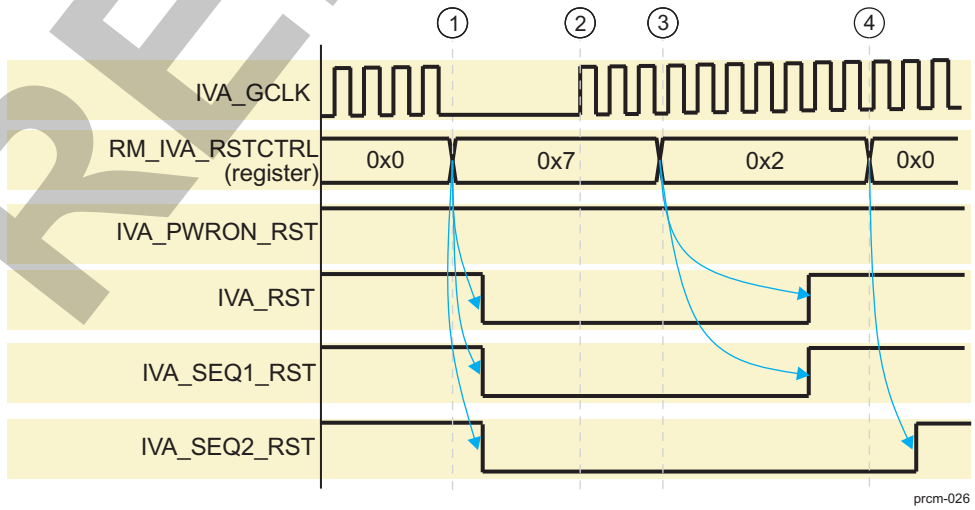
The power-on reset sequence is:

1. Software clears the RM_IVA_RSTCTRL[2] RST_LOGIC bit. This causes the PRCM module to release the IVA_PWRON_RST reset used inside IVA mainly to reset the emulation logic and the IVA_RST reset used to reset all logic inside IVA. Then software can download data into TCM memory while keeping the sequencer CPUs under reset.
2. When the TCM memory is initialized, software clears the RM_IVA_RSTCTRL[0] RST_SEQ1 bit. This releases IVA_SEQ1_RST reset to the Sequencer1 CPU.
3. Similarly, software can clear the RM_IVA_RSTCTRL[1] RST_SEQ2 bit. This releases IVA_SEQ2_RST reset to the Sequencer2 CPU.

3.5.6.7 IVA Subsystem Software Warm Reset Sequence

Figure 3-25 shows the software warm reset sequence of the IVA subsystem.

Figure 3-25. IVA Software Warm Reset Sequence



Before asserting the software reset to the IVA subsystem the MPU software must ensure that:

- IVA sequencer CPUs are in IDLE state (CM_IVA_IVA_CLKCTRL[17:16] IDLEST).
- The IVA subsystem is in STANDBY state (CM_IVA_IVA_CLKCTRL[18] STBYST).
- The functional clock to the IVA subsystem has been gated by the PRCM module (CM_IVA_CLKSTCTRL[8] CLKACTIVITY_IVA_GCLK).

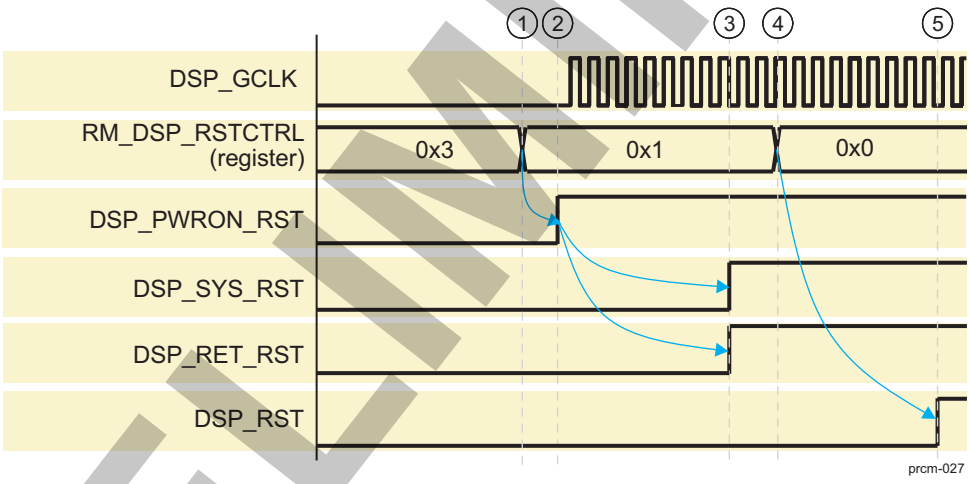
The software reset sequence is:

1. The MPU software sets the RM_IVA_RSTCTRL[2] RST_LOGIC, RM_IVA_RSTCTRL[1] RST_SEQ2, and RM_IVA_RSTCTRL[0] RST_SEQ1 bits. This causes the PRCM module to assert the IVA_RST, IVA_SEQ1_RST, and IVA_SEQ2_RST resets to the IVA subsystem. The IVA_PWRON_RST remains deasserted.
2. The MPU software enables the functional clock to the IVA subsystem.
3. The MPU software clears the RM_IVA_RSTCTRL[2] RST_LOGIC and RM_IVA_RSTCTRL[0] RST_SEQ1 bits. This causes the PRCM module to release the IVA_RST and IVA_SEQ1_RST resets to the IVA subsystem.
4. The MPU software clears the RM_IVA_RSTCTRL[1] RST_SEQ2 bit. This releases the IVA_SEQ2_RST reset to the Sequencer2 CPU.

3.5.6.8 DSP Subsystem Power-On Reset Sequence

Figure 3-26 shows the power-on reset sequence of the DSP subsystem.

Figure 3-26. DSP Subsystem Power-On Reset Sequence



The assumptions on power-on reset assertion are:

- PD_DSP is on.
- The MPU software sets the CM_DSP_DSP_CLKCTRL[1:0] MODULEMODE bit field to Auto (0x1).
- The MPU software sets the CM_DSP_CLKSTCTRL[1:0] CLKTRCTRL bit field to SW_WKUP or HW_AUTO.
- DPLL_IVA is active and is providing the DSP_GCLK. It can be locked before this sequence.

The Power-On Reset sequence is:

1. MPU software clears the RM_DSP_RSTCTRL[1] RST_DSP_MMU_CACHE bit in the PRCM module register to release the DSP, MMU_DSP, and CACHE_DSP interface from reset.
2. The PRCM module releases DSP_PWRON_RST when the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) reaches its limit. Upon deassertion of the POR signal, the DSP subsystem starts the initialization sequence. During this initialization sequence all the internal registers inside the DSP are properly reset and DSP, MMU_DSP, and CACHE_DSP interface are reset.
3. When the reset sequence of Step 2 completes and the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) expires, the PRCM module releases the DSP_SYS_RST and DSP_RET_RST signals.
4. MPU software must configure the MMU_DSP once the MMU_DSP is out of reset. After MMU_DSP

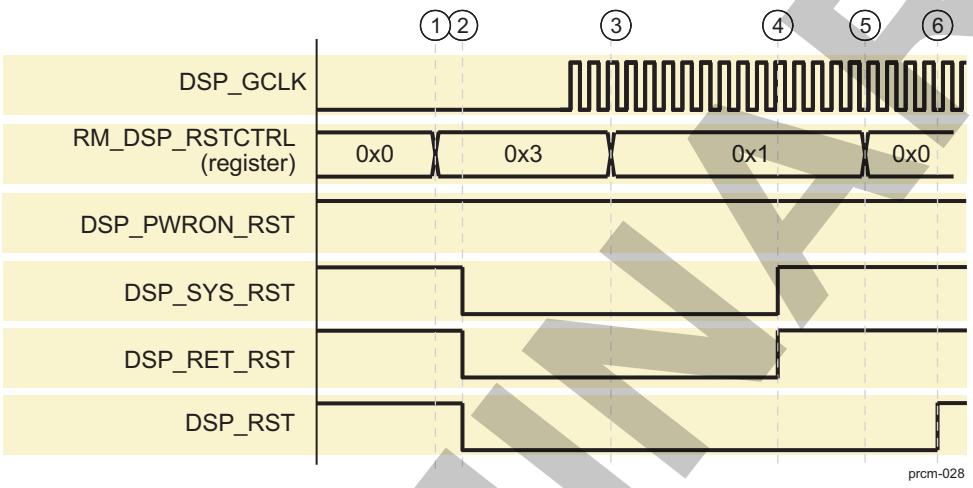
configuration is done, MPU software clears the RM_DSP_RSTCTRL[0] RST_DSP bit in the PRCM module register.

5. The PRCM module releases DSP_RST, which causes the DSP to start booting.

3.5.6.9 DSP Subsystem Software Warm Reset Sequence

Figure 3-27 shows the software warm reset sequence of the DSP subsystem.

Figure 3-27. DSP Subsystem Software Warm Reset Sequence



The assumptions on software warm reset assertion are:

- The DSP is in IDLE state.
- The DSP_GCLK (functional clock) is gated.

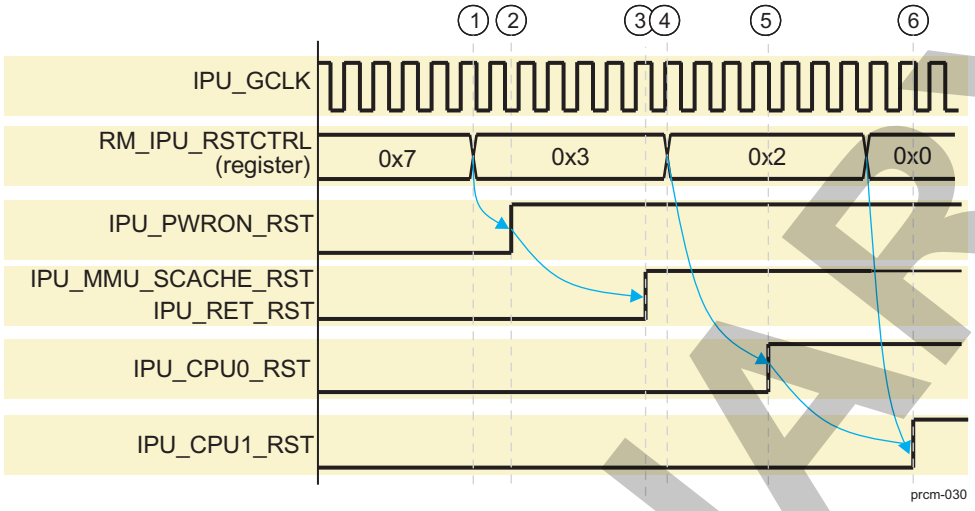
The software warm reset sequence is:

1. MPU software sets the RM_DSP_RSTCTRL[1] RST_DSP_MMU_CACHE and RM_DSP_RSTCTRL[0] RST_DSP bits.
2. The PRCM module asserts the DSP_SYS_RST, DSP_RET_RST, and DSP_RST reset signals. DSP_PWRON_RST remains deasserted in this case.
3. MPU software reenables DSP_GCLK and clears the RM_DSP_RSTCTRL[1] RST_DSP_MMU_CACHE bit in the PRCM module register to reset DSP, MMU_DSP, and CACHE_DSP interface. The DSP subsystem starts the partial initialization sequence for the warm reset.
4. When the reset sequence of Step 3 completes and the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) expires, the PRCM module releases the DSP_SYS_RST and DSP_RET_RST signals.
5. MPU software clears the RM_DSP_RSTCTRL[0] RST_DSP bit in the PRCM module register.
6. The PRCM module releases DSP_RST, which causes the DSP to start booting.

3.5.6.10 IPU Subsystem Power-On Reset Sequence

Figure 3-28 shows the power-on reset sequence of the IPU subsystem.

Figure 3-28. IPU Power-On Reset Sequence



The assumptions on power-on reset assertion are:

- The IPU subsystem is held in reset by the PRCM module and the following are asserted:
  - IPU_PWRON_RST
  - IPU_RET_RST
  - IPU_CPU0_RST
  - IPU_CPU1_RST
  - IPU_MMU_CACHE_RST

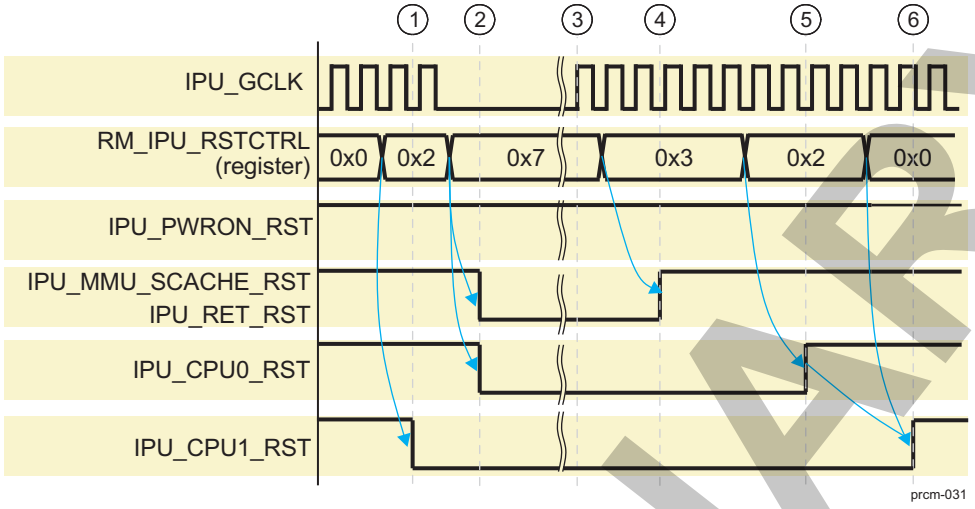
The power-on reset sequence is:

1. Software clears the RM_IPU_RSTCTRL[2] RST_IPU_MMU_CACHE bit in the PRCM module register to release the IPU shared cache and CACHE_MMU_IPU from reset.
2. The PRCM module releases IPU_PWRON_RST once the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) reaches its limit and the IPU_GCLK is running. Upon deassertion of the POR signal, the IPU subsystem starts the CPU and CACHE_MMU_IPU initialization sequence.
3. When the reset sequence of Step 2 completes and the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) expires, the PRCM module releases the IPU_MMU_CACHE_RST and IPU_RET_RST signals.
4. MPU software must configure CACHE_MMU_IPU once CACHE_MMU_IPU is out of reset. After CACHE_MMU_IPU configuration and cache initialization is done, MPU software clears the RM_IPU_RSTCTRL[0] RST_CPU0 bit in the PRCM module register.
5. The PRCM module releases IPU_CPU0_RST, which causes IPU_C0 to start booting.
6. MPU software can clear the RM_IPU_RSTCTRL[1] RST_CPU1 bit in the PRCM module register so that the PRCM module releases the IPU_CPU1_RST to IPU_C1.

3.5.6.11 IPU Subsystem Software Warm Reset Sequence

Figure 3-29 shows the software warm reset sequence of the IPU subsystem.

Figure 3-29. IPU Subsystem Software Warm Reset Sequence



For doing the software reset of IPU, the MPU software must ensure that IPU CPUs (IPU_C0 and IPU_C1) are in IDLE state and clock is gated

The software warm reset sequence is:

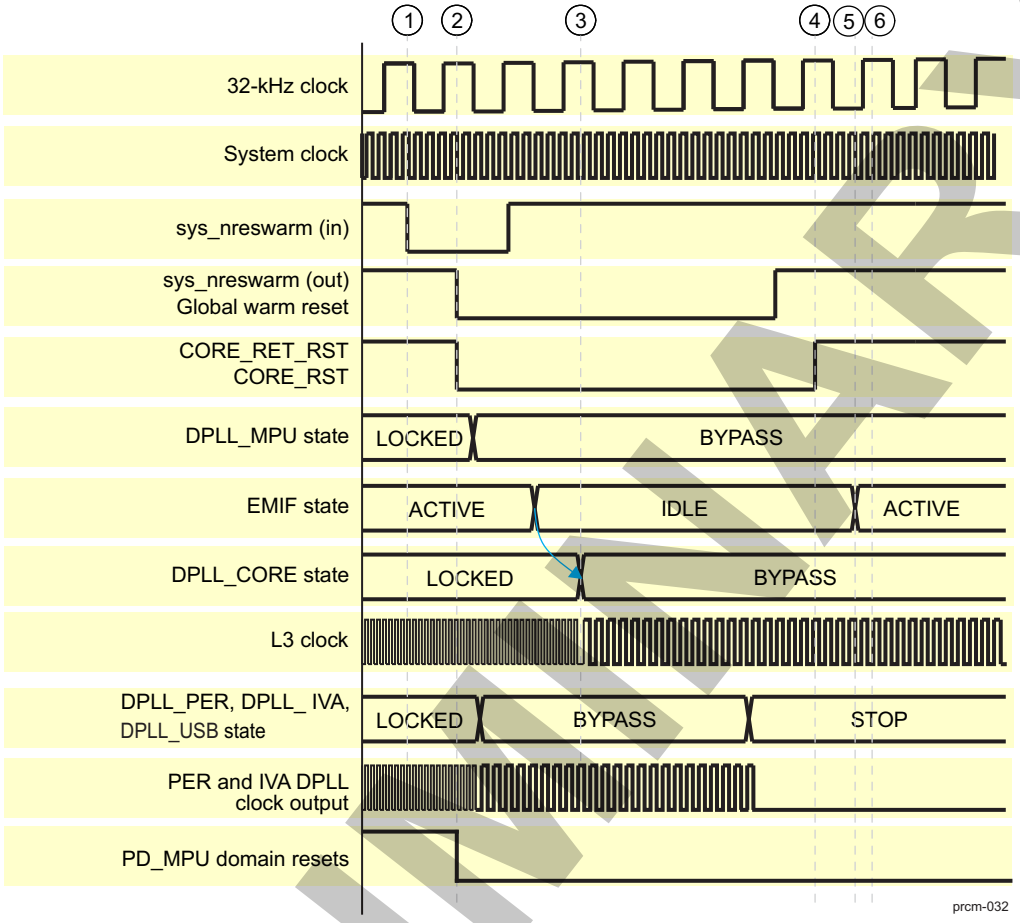
1. When IPU_C1 is in IDLE state, IPU_C0 software or MPU software sets the RM_IPU_RSTCTRL[1] RST_CPU1 bit. The PRCM module asserts the IPU_CPU1_RST reset signal to IPU_C1.
2. When IPU_C0 is in IDLE state, the MPU software sets the RM_IPU_RSTCTRL[2] RST_IPU_MMU_CACHE and RM_IPU_RSTCTRL[0] RST_CPU0 bits.
3. The PRCM module asserts the IPU_MMU_CACHE_RST, IPU_RET_RST, and IPU_CPU0_RST reset signals. The IPU_PWRON_RST remains deasserted in this case.
4. The MPU software reenables the IPU_GCLK and the initialization sequence starts inside the IPU subsystem. Software clears the RM_IPU_RSTCTRL[2] RST_IPU_MMU_CACHE bit and RM_IPU_RSTCTRL[0] RST_CPU0 bit in the PRCM module register.
5. When the reset sequence of Step 4 completes and the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) expires, the PRCM module releases the IPU_MMU_CACHE_RST, IPU_RET_RST, and IPU_CPU0_RST reset signals. IPU_C0 starts rebooting.
6. Software can then clear the RM_IPU_RSTCTRL[1] RST_CPU1 bit in the PRCM module register. The PRCM module releases the IPU_CPU1_RST reset signal to IPU_C1 to start booting.

3.5.6.12 Global Warm Reset Sequence

This section describes the global warm reset sequence.

Figure 3-30 shows the global warm reset sequence.

Figure 3-30. Global Warm Reset Sequence



The assumptions are:

- All the logic and memory voltage sources are at their nominal voltage levels.
- The device is active:
  - All resets are released.
  - MPU, CORE, and IVA DPLLs are locked.

The steps of a global warm reset sequence are:

1. On assertion of any global warm reset source the PRM signals the EMIF that a global warm reset event has occurred. The EMIF initiates the transition to IDLE state. The PRCM module delays global warm reset to the device for a minimum of 16 L3 clock cycles so that the EMIF switches to IDLE state and switches the external SDRAM to self-refresh mode.
2. The reset managers in the PRM assert the following resets:
   - The external warm reset SYS_WARM_RST (output) to the SCRM
   - All power domain warm resets are asserted.
   - DPLL hardware resets are not asserted.
     - DPLL_MPU transitions to bypass mode.
     - DPLL_CORE transitions to bypass mode once the EMIF switches to IDLE state.
     - DPLL_IVA, DPLL_PER and DPLL_USB transition to idle bypass low-power mode. Then as clock signals are no more requested, they are gated and these DPLLs goes to stop mode.
     - DPLL_ABE configuration is not changed.
   - The system clock remains active.
   - The PRM and CM registers, sensitive to warm reset, are asynchronously reset.

- CM gates the clocks that are not needed, as per their default reset setting in the associated registers.

3. After the warm reset source is released, the global warm reset (internal and external) is extended until the following conditions are met:
   - The device reset manager counter overflows. It is set up by the PRM_RSTTIME[9:0] RSTTIME1 bit field. During this time, the DPLL_ABE control registers are reset and DPLL_ABE transitions to bypass mode when the system clock restarts and the DPLL_ABE outputs are no longer used.
   - All logic voltage sources (VD_MM, VD_MPU and VD_CORE) are stable.

NOTE: Voltage stabilization is an additional condition if voltage scaling was performed before the assertion of the warm reset.

4. The CORE power domain is released from reset (that is, warm reset-sensitive modules in the CORE power domain).
5. The PRCM module switches the EMIF from IDLE state back to ACTIVE state.
6. PD_MPU is released from reset when the clocks to the MPU subsystem are active. The MPU reboots.

NOTE:

- The PD_DSP and PD_IVA power domains are held under reset after global warm reset by assertion of the software source of the reset.
- The following are held under reset after global warm reset until the PRCM module enables their interface clock:
  - PD_L3INIT
  - PD_DSS
  - PD_GPU
  - PD_CAM

External power IC is sensitive to warm reset. When it detects a warm reset, it initiates its warm reset sequence to ramp all regulators.

3.6 Clock Management Functional Description

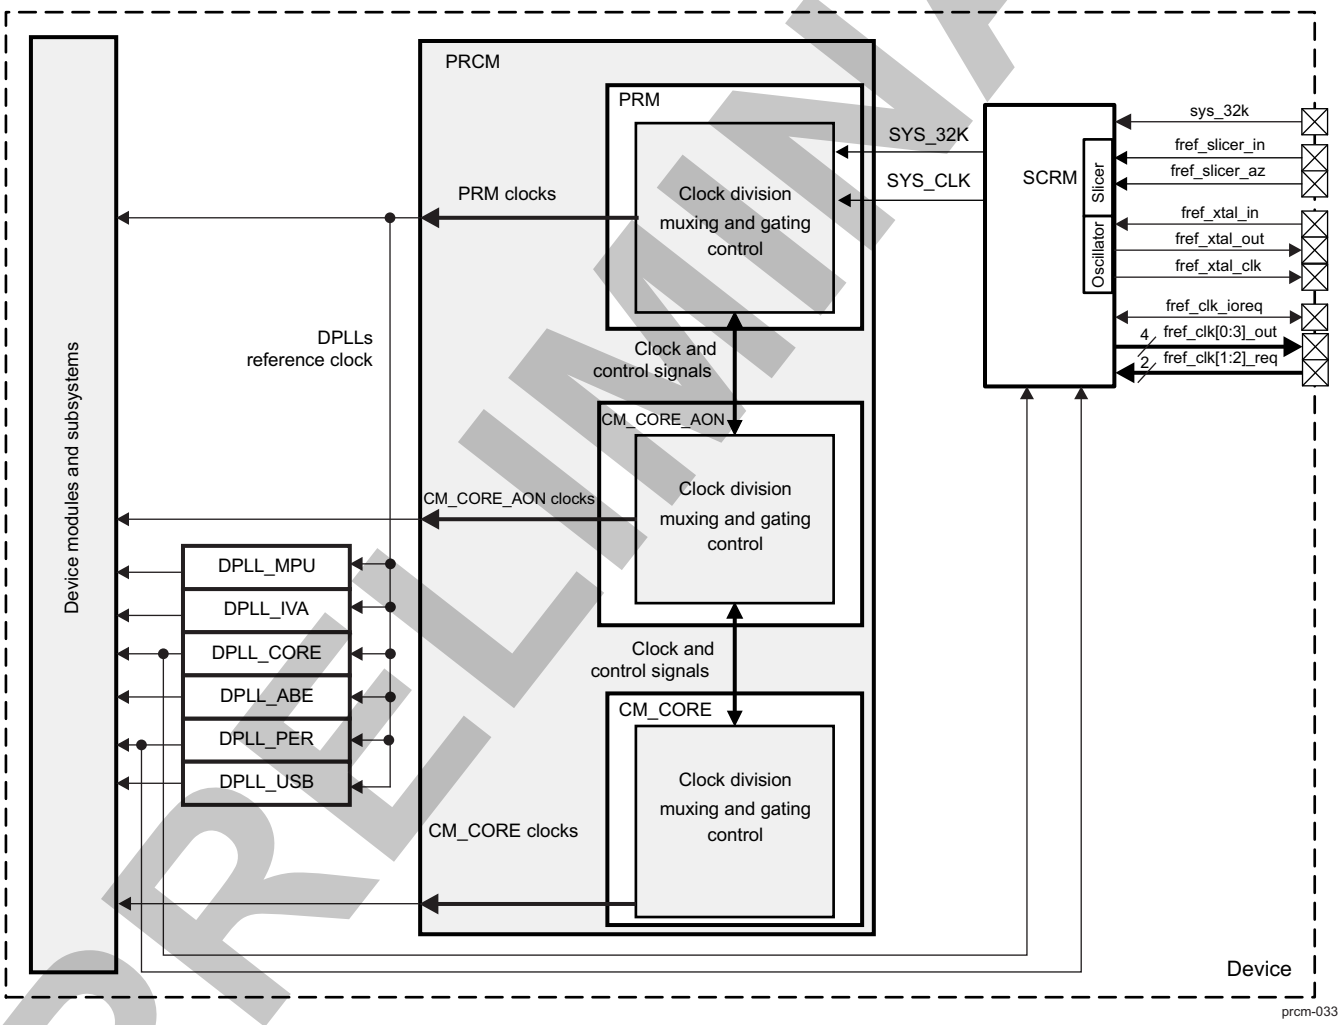
3.6.1 Overview

The PRCM module provides the control for clock generation, division, distribution, synchronization, and gating. It distributes the clock sources to all modules in the device. For information about the clock-management functional architecture of the device, see Section 3.1.1.1, *Clock Management*.

The high-frequency system clock is received by the device from an external source or generated within the device (internal oscillator) by the SCRM. The SCRM also receives the 32-kHz low-frequency clock from the external source.

The stable versions of the system and 32-kHz clock are provided by the SCRM to the PRCM module. The PRCM module provides clocks to the internal DPLLs for internal high-frequency clock generation. Clock division and gating are handled by the PRM, CM_CORE_AON, and CM_CORE sections of the PRCM module. Figure 3-31 shows the high-level clock-management scheme in the device.

Figure 3-31. PRCM Module Clock Manager Overview



3.6.2 External Clock Inputs

3.6.2.1 sys_32k Clock Input

The 32-kHz frequency is used for low-frequency operation (timer, debouncing, etc.). It supplies the always-on wake-up domain for operation in lowest power mode and as the clock source to the DPLL_ABE module (for audio back-end [ABE]).

3.6.2.2 High-Frequency System Clock Input

The system clock, SYS_CLK, is the main source clock of the device. SYS_CLK is received directly from the SCRM by the PRM subsection of the PRCM module. It is supplied as the reference clock to the DPLLs and as functional clock to several modules.

3.6.3 Internal Clock Sources/Generators

The PRCM module clock sources/generators are split into the following parts:

- PRM clock source that receives the 32-kHz and system clocks from SCRM
- CM_CORE_AON and CM_CORE clock sources that distribute high-frequency clocks
- DPLL clock generators that synthesize high-frequency clocks for the device

Table 3-37. Internal Clock Sources

Clock Name	Source	Frequency	Note
FUNC_32K_CLK	SYS_32K	32KHz	See Section 3.6.3.1, *PRM Clock Source*
SYS_CLKIN	SYS_CLKIN	12, 16.8, 19.2, 26, 38.4MHz	See Section 3.6.3.1, *PRM Clock Source*
FUNC_96M_AON_CLK	DPLL_PER	96MHz	See Section 3.6.3.4, *DPLL_PER Description*
FUNC_192M_CLK	DPLL_PER	192MHz	See Section 3.6.3.4, *DPLL_PER Description*
FUNC_256M_CLK	DPLL_PER	256MHz	See Section 3.6.3.4, *DPLL_PER Description*
CORE_CLK	DPLL_CORE	532MHz	See Section 3.6.3.5, *DPLL_CORE Description*

3.6.3.1 PRM Clock Source

The PRM clock source receives the SYS_32K and SYS_CLK clocks from the SCRM. Along with these clocks, it receives a clock (ABE_LP_CLK) from ABE, generated by DPLL_ABE. The PRM manages the low-frequency clocks associated with these three input clocks. The PRM sources various versions (through gating controls) of these externally sourced clocks to supply:

- PRCM-managed DPLLs with a reference clock, which is permanently supplied with always-on buffers
- The SMARTREFLEX modules with a reference clock, which is permanently supplied with always-on buffers
- The DSS with a reference clock, which is permanently supplied with always-on buffers
- The various timers and watchdog timers with clocks supplied by always-on buffers
- The clocks for the CM clock generator and the CORE power domain
- A version of SYS_CLK to ABE supplied by always-on buffers
- Timer functional clocks
- The bandgap and control module for thermal sensor feature
- Reference clock for various modules:
  - USB_OTG_SS
  - SATA

Figure 3-32 is a logical representation of the PRM clock source.

Figure 3-32. PRM Clock Manager Overview

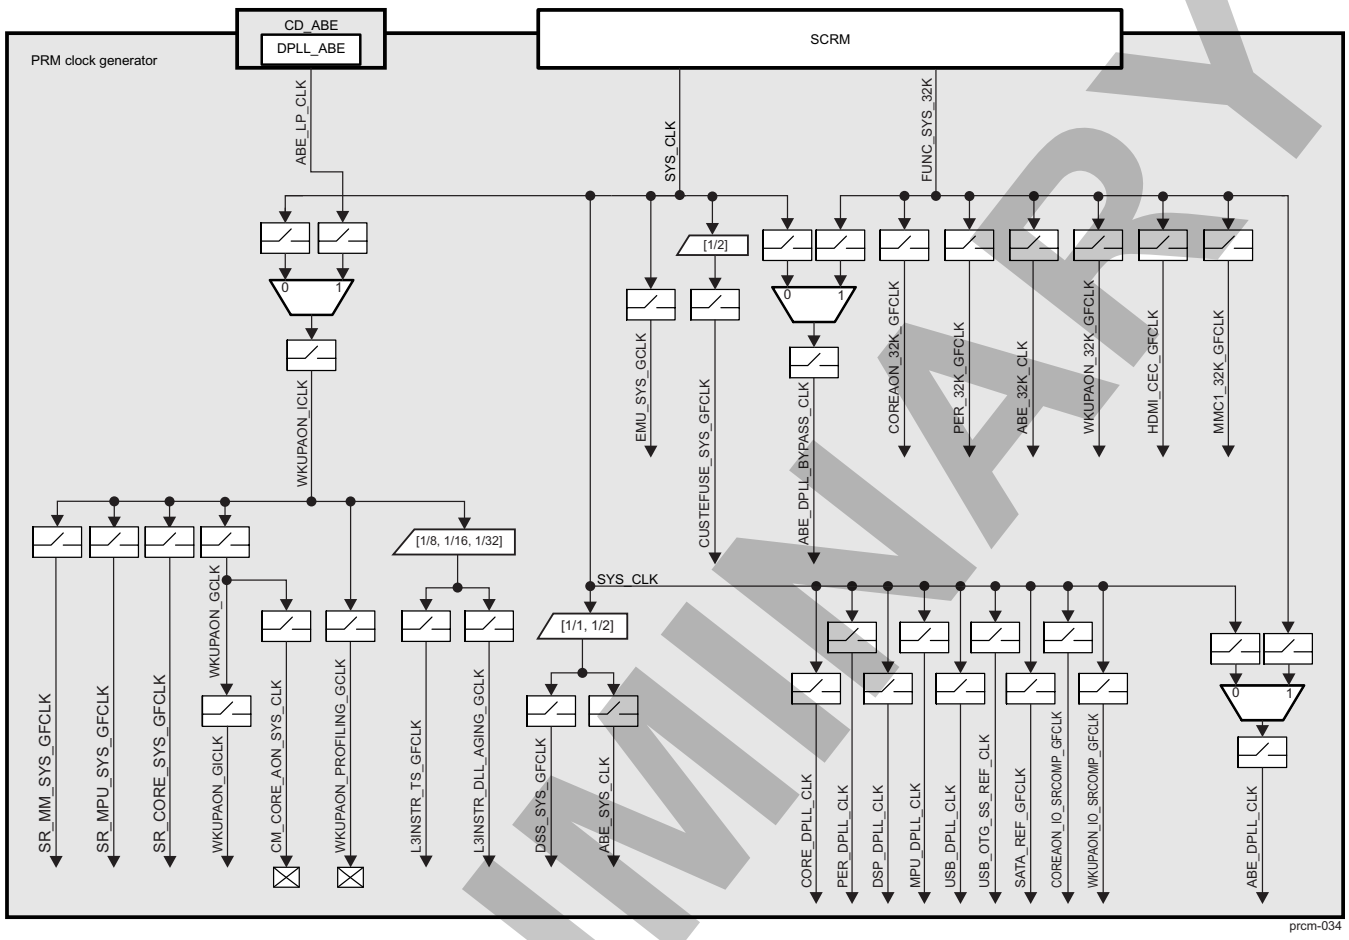


Table 3-38 identifies controls for clock dividers or muxes in the PRM.

Table 3-38. PRM Clock Division and Muxing Control

Divider/Mux	Control Bit Field
Mux ABE_DPLL_CLK	CM_CLKSEL_ABE_PLL_REF[0] CLKSEL
Mux WKUPAON_ICLK	CM_CLKSEL_WKUPAON[0] CLKSEL
Mux ABE_DPLL_BYPASS_CLK	CM_CLKSEL_WKUPAON[0] CLKSEL
Divider ABE_SYS_CLK and DSS_SYS_GFCLK	CM_CLKSEL_ABE_DSS_SYS[0] CLKSEL
Divider MPU_DPLL_CLK – ABE	CM_MPU_MPU_CLKCTRL[26] CLKSEL_ABE_DIV_MODE
Divider MPU_DPLL_CLK – EMIF	CM_MPU_MPU_CLKCTRL[25:24] CLKSEL_EMIF_DIV_MODE
Divider L3INSTR_TS_GFCLK	CM_L3INSTR_CTRL_MODULE_BANDGAP_CLKCTRL[25:24] CLKSEL

NOTE: For clock signals control (gating/ungating management), see Section 3.1.1.1, *Clock Management*.

The PRM provides a 32-kHz gated and ungated clock for use by portions of the PD_WKUPAON power domain and some peripherals outside the PD_WKUPAON power domain.

It also provides the system clock to the DSS, a gated and buffered version to the WKUPAON_GICLK interconnect clock, and the DPLLs controlled by the PRCM module. The gated version of SYS_CLK is also provided to the SmartReflex modules of the device.

PRM creates MMC1_32K_GFCLK, a gated version of SYS_32K provided to MMC1. This clock may be used by MMC1 for debouncing. It is controlled by the software through writing bit CM_L3INIT_MMC1_CLKCTRL[8] OPTFCLKEN_32KHZ_CLK.

3.6.3.1.1 CD_PRM_TIMER Overview

Figure 3-33 is an overview of the PRM clock manager related to the device timers.

Figure 3-33. CD_PRM_TIMER

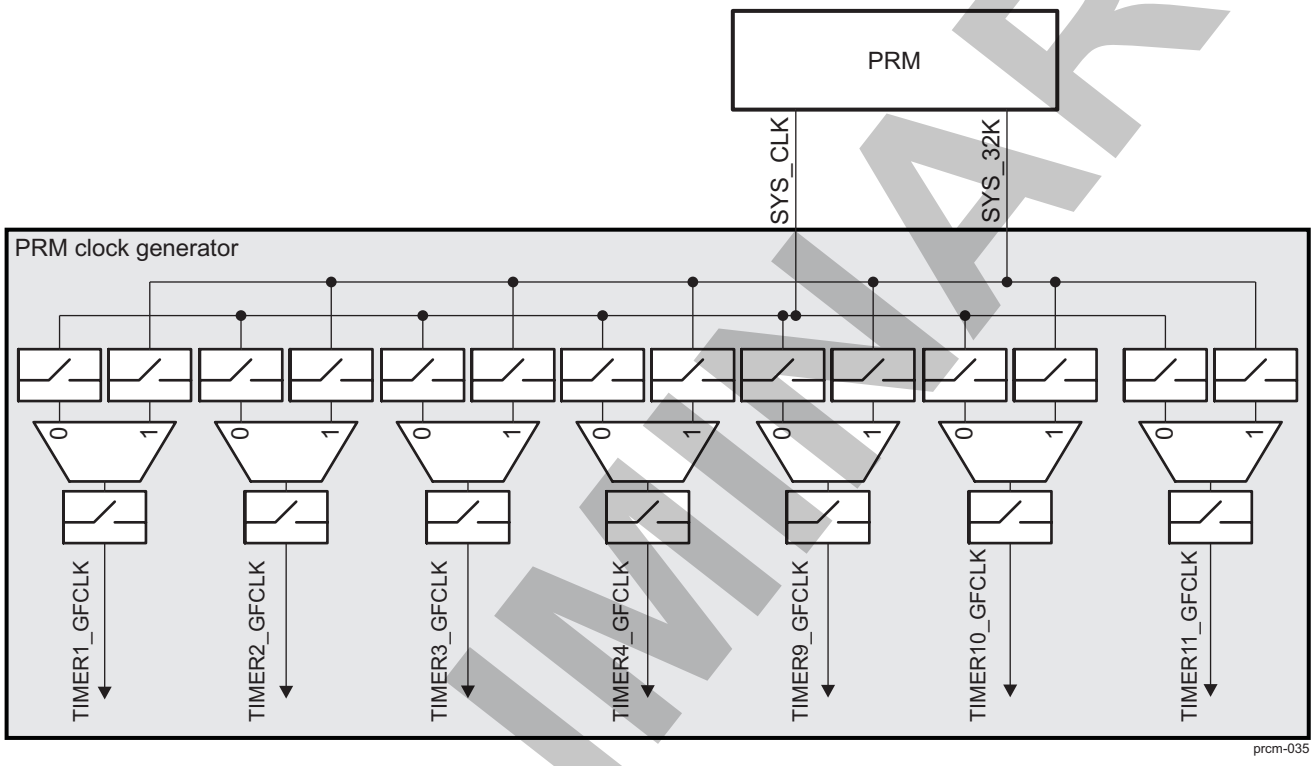

Table 3-39 identifies controls for clock muxes in the CD_PRM_TIMER.

Table 3-39. CD_PRM_TIMER Clock Division and Muxing Control

Divider/Mux	Control Bit Field
Mux TIMER1_GFCLK	CM_WKUPAON_TIMER1_CLKCTRL[24]CLKSEL
Mux TIMER2_GFCLK	CM_L4PER_TIMER2_CLKCTRL[24]CLKSEL
Mux TIMER3_GFCLK	CM_L4PER_TIMER3_CLKCTRL[24]CLKSEL
Mux TIMER4_GFCLK	CM_L4PER_TIMER4_CLKCTRL[24]CLKSEL
Mux TIMER9_GFCLK	CM_L4PER_TIMER9_CLKCTRL[24]CLKSEL
Mux TIMER10_GFCLK	CM_L4PER_TIMER10_CLKCTRL[24]CLKSEL
Mux TIMER11_GFCLK	CM_L4PER_TIMER11_CLKCTRL[24]CLKSEL

NOTE: For clock signals control (gating/ungating management), see Section 3.1.1.1, *Clock Management*.

3.6.3.2 CM Clock Source

The clock manager (CM) is primarily responsible for generating interface and functional clocks from the internal clocks provided by DPLL_CORE and DPLL_PER. The CM is physically divided into two independent entities: CM_CORE_AON, which is placed in the PD_COREAON always-on power domain, and CM_CORE, which is placed in the PD_CORE switchable power domain. The split is done to provide control over various entities, such as modules, DPLLs, and clocks, during low-power use case scenarios when the PD_CORE power domain can be switched to RETENTION state.

3.6.3.2.1 CM_CORE_AON Clock Generator

CM_CORE_AON receives a system clock from the PRM, which serves as its functional clock. CM_CORE_AON provides a gated clock to PD_ABE, PD_DSP, PD_MPU, and some DPLLs (DPLL_MPU, DPLL_IVA and its associated HSDivider,DPLL_ABE, DPLL_CORE and its associated HSDivider). It also provides the clock to the L3 and L4 interconnects in the device.

Figure 3-34 shows the various functional and interface clocks generated by CM_CORE_AON.

Figure 3-34. CM_CORE_AON Overview

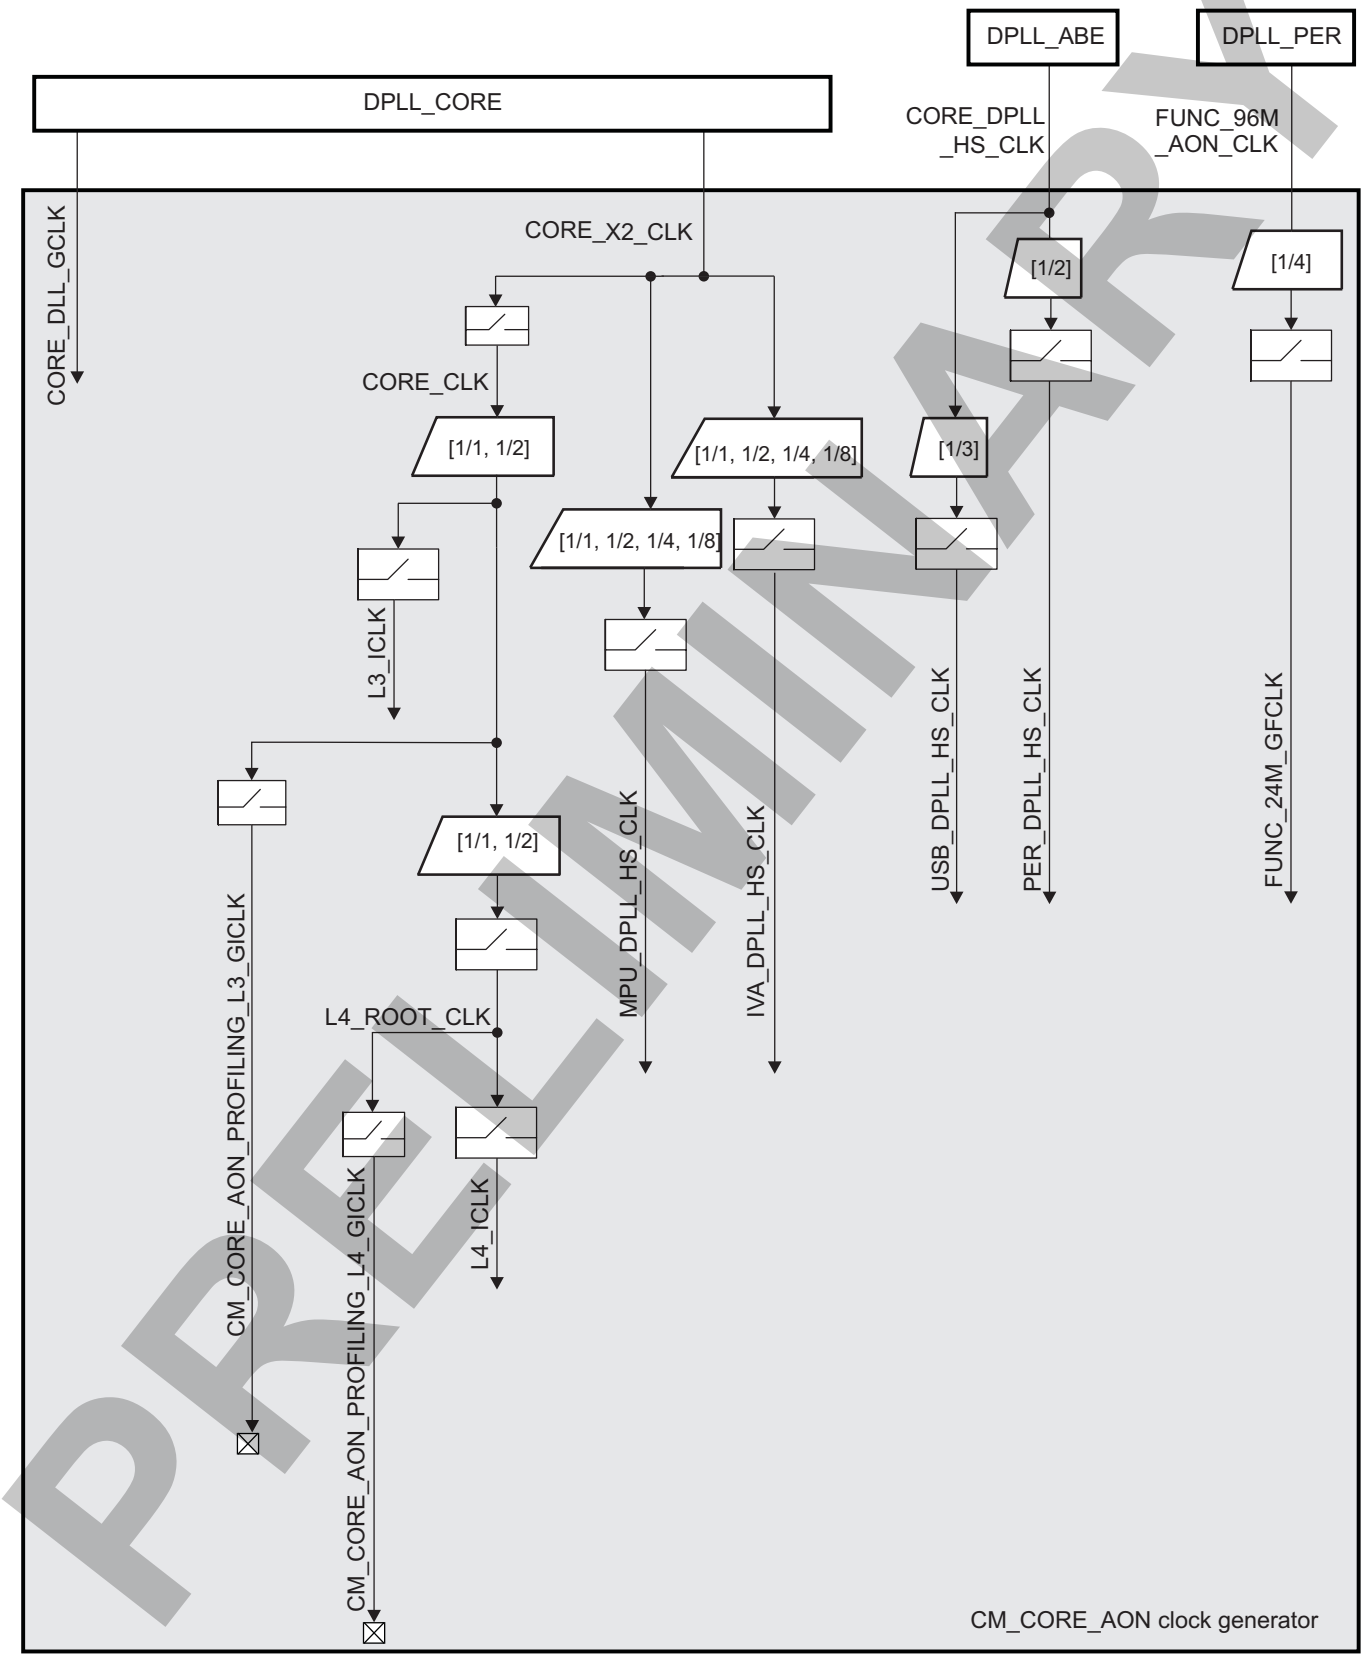

Table 3-40 identifies controls for clock dividers or muxes in the CM_CORE_AON clock source.

Table 3-40. CM_CORE_AON Clock Division and Muxing Control

Divider/Mux	Control Bit Field
Divider L3_ICLK	CM_CLKSEL_CORE[4] CLKSEL_L3
Divider L4_ROOT_CLK	CM_CLKSEL_CORE[8] CLKSEL_L4
Divider MPU_DPLL_HS_CLK	CM_BYPCLK_DPLL_MPU[1:0] CLKSEL
Divider IVA_DPLL_HS_CLK	CM_BYPCLK_DPLL_IVA[1:0] CLKSEL

NOTE: For clock signals control (gating/ungating management), see Section 3.1.1.1, *Clock Management*.

3.6.3.2.2 CKGEN_USB Clock Generator

CKGEN_USB receives a system clock from DPLL_USB. It provides a gated clock to CD_L3INIT.

Figure 3-35 shows the various functional and interface clocks generated by CKGEN_USB.

Figure 3-35. CKGEN_USB Clock Manager Overview

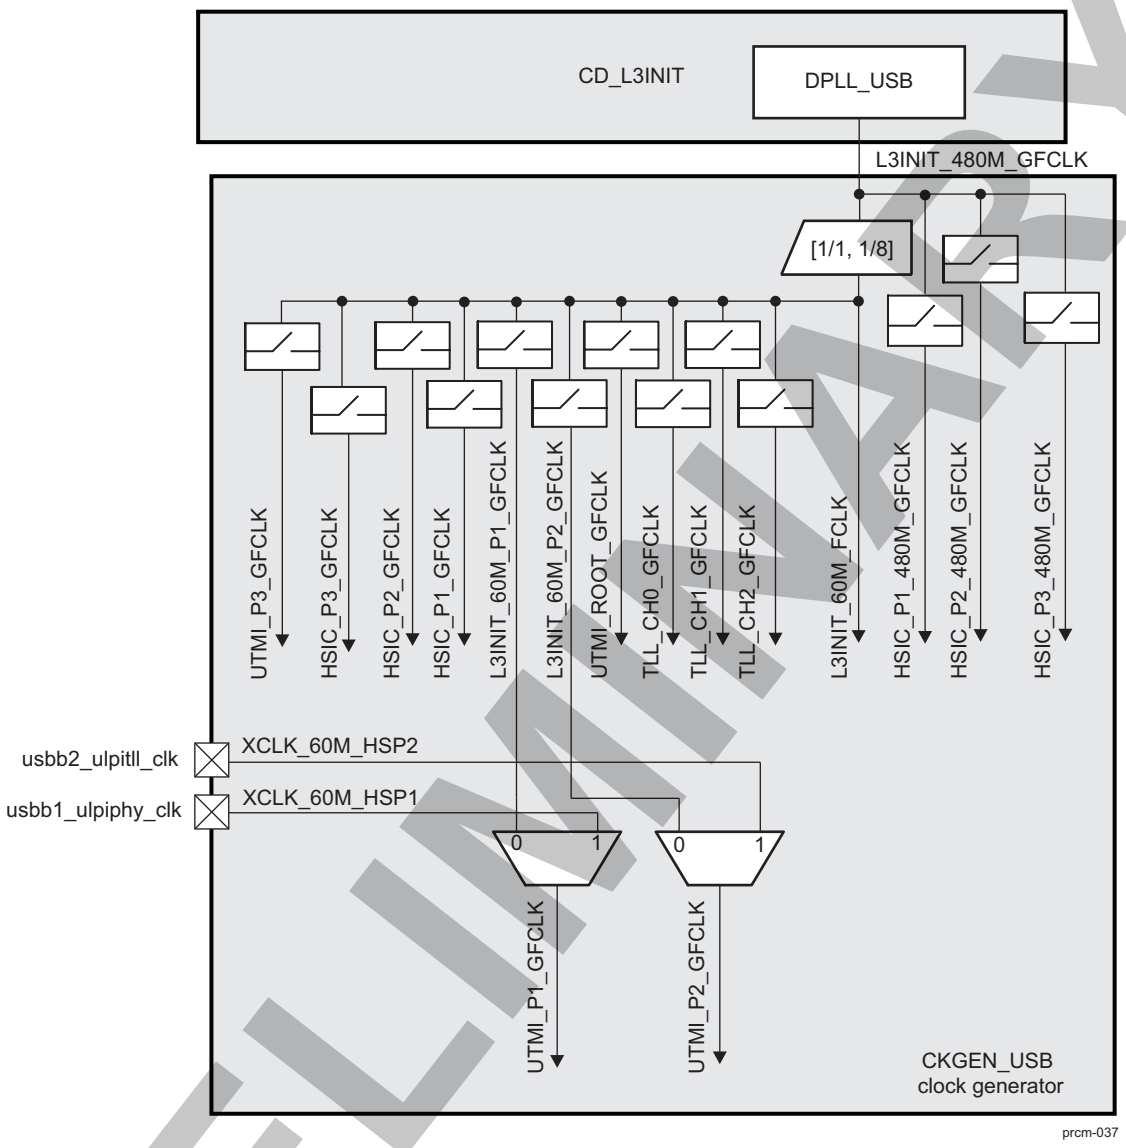

Table 3-41 identifies controls for clock dividers or muxes in the CKGEN_USB clock source.

Table 3-41. CKGEN_USB Clock Division and Muxing Control

Switch HSIC_P1_480M_GFCLK	CM_L3INIT_USB_HOST_HS_CLKCTRL[13] OPTFCLKEN_HSIC480M_P1_CLK
Switch HSIC_P2_480M_GFCLK	CM_L3INIT_USB_HOST_HS_CLKCTRL[14] OPTFCLKEN_HSIC480M_P2_CLK
Switch HSIC_P3_480M_GFCLK	CM_L3INIT_USB_HOST_HS_CLKCTRL[7] OPTFCLKEN_HSIC480M_P3_CLK
Switch HSIC_P1_GFCLK	CM_L3INIT_USB_HOST_HS_CLKCTRL[11] OPTFCLKEN_HSIC60M_P1_CLK
Switch HSIC_P2_GFCLK	CM_L3INIT_USB_HOST_HS_CLKCTRL[12] OPTFCLKEN_HSIC60M_P2_CLK

Table 3-41. CKGEN_USB Clock Division and Muxing Control (continued)

Divider/Mux/Switch	Control Bit Field
Switch HSIC_P3_GFCLK	CM_L3INIT_USB_HOST_HS_CLKCTRL[6] OPTFCLKEN_HSIC60M_P3_CLK
Switch UTMI_P1_GFCLK	CM_L3INIT_USB_HOST_HS_CLKCTRL[8] OPTFCLKEN_UTMI_P1_CLK
Switch UTMI_P2_GFCLK	CM_L3INIT_USB_HOST_HS_CLKCTRL[9] OPTFCLKEN_UTMI_P2_CLK
Switch UTMI_P3_GFCLK	CM_L3INIT_USB_HOST_HS_CLKCTRL[10] OPTFCLKEN_UTMI_P3_CLK

NOTE: For the clock status bits, see Table 3-130.

NOTE: For clock signals control (gating/ungating management), see Section 3.1.1.1, *Clock Management*.

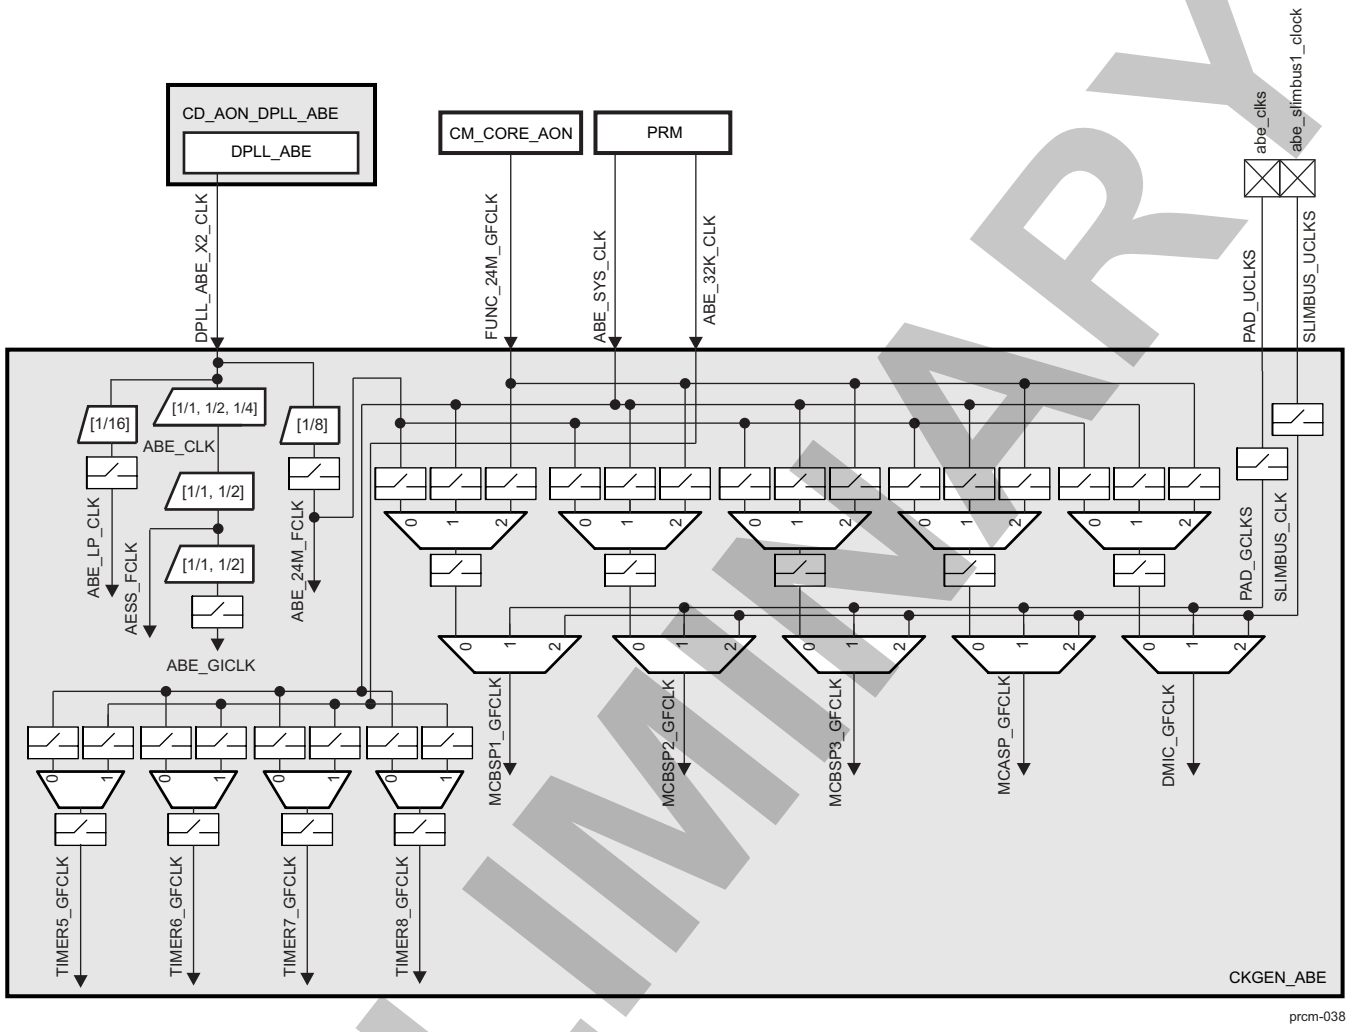
NOTE: For information about the CKGEN_USB clock signals control and status, see Section 3.6.10, *CD_L3INIT Clock Domain*.

3.6.3.2.3 CKGEN_ABE Clock Generator

CKGEN_ABE receives a system clock from the PRM.

Figure 3-36 shows the various functional and interface clocks generated by the CKGEN_ABE clock source.

Figure 3-36. CKGEN_ABE Clock Manager Overview



prcm-038

Table 3-42 identifies the controls for clock dividers or muxes in CKGEN_ABE.

Table 3-42. CKGEN_ABE Clock Division and Muxing Control

Divider/Mux	Control Bit Field
Clock switch PAD_GCLKS	CM_CLKSEL_ABE[8] PAD_CLKS_GATE
Clock switch SLIMBUS_CLK	CM_CLKSEL_ABE[10] SLIMBUS1_CLK_GATE
Divider ABE_CLK	CM_CLKSEL_ABE[1:0] CLKSEL_OPP
Divider AESS_FCLK and ABE_GICLK(1)	CM_ABE_AESS_CLKCTRL[24] CLKSEL_AESS_FCLK
Mux TIMER5_GFCLK	CM_ABE_TIMER5_CLKCTRL[24] CLKSEL
Mux TIMER6_GFCLK	CM_ABE_TIMER6_CLKCTRL[24] CLKSEL
Mux TIMER7_GFCLK	CM_ABE_TIMER7_CLKCTRL[24] CLKSEL
Mux TIMER8_GFCLK	CM_ABE_TIMER8_CLKCTRL[24] CLKSEL
Mux DMIC_GFCLK	CM_ABE_DMIC_CLKCTRL[25:24] CLKSEL_SOURCE
Mux DMIC internal functional clock	CM_ABE_DMIC_CLKCTRL[27:26] CLKSEL_INTERNAL_SOURCE
Mux MCASP internal functional clock	CM_ABE_MCASP_CLKCTRL[27:26] CLKSEL_INTERNAL_SOURCE
Mux MCASP_GFCLK	CM_ABE_MCASP_CLKCTRL[25:24] CLKSEL_SOURCE

(1) ABE_GICLK depends on the divider settings of AESS_GFCLK and is always divided by 2 of the ABE_CLK. Therefore, when the AESS_GFCLK divider is set to 1, the ABE_GICLK divider is set to 2, and vice versa.

Table 3-42. CKGEN_ABE Clock Division and Muxing Control (continued)

Divider/Mux	Control Bit Field
Mux MCBSP1_GFCLK	CM_ABE_MCBSP1_CLKCTRL[25:24] CLKSEL_SOURCE
Mux MCBSP1 internal functional clock	CM_ABE_MCBSP1_CLKCTRL[27:26] CLKSEL_INTERNAL_SOURCE
Mux MCBSP2_GFCLK	CM_ABE_MCBSP2_CLKCTRL[25:24] CLKSEL_SOURCE
Mux MCBSP2 internal functional clock	CM_ABE_MCBSP2_CLKCTRL[27:26] CLKSEL_INTERNAL_SOURCE
Mux MCBSP3_GFCLK	CM_ABE_MCBSP3_CLKCTRL[25:24] CLKSEL_SOURCE
Mux MCBSP3 internal functional clock	CM_ABE_MCBSP3_CLKCTRL[27:26] CLKSEL_INTERNAL_SOURCE

NOTE: For the ABE subsystem, functional clock DPLL_ABE_X2_CLK must be set to 196.608 MHz in DPLL_ABE. ABE_CLK, which is sourced by the DPLL_ABE_X2_CLK, can be configured in the CM_CLKSEL_ABE[1:0] CLKSEL_OPP bit field according to the OPP. AESS_FCLK can be the same as ABE_CLK or ABE_CLK divided by 2, depending on the CM_ABE_AESS_CLKCTRL[24] CLKSEL_AESS_FCLK bit. For more information about setting DPLL parameters, see Section 3.6.3.3.1, *DPLLs Output Clocks Parameters*.

NOTE: For clock signals control (gating/ungating management), see Section 3.1.1.1, *Clock Management*.

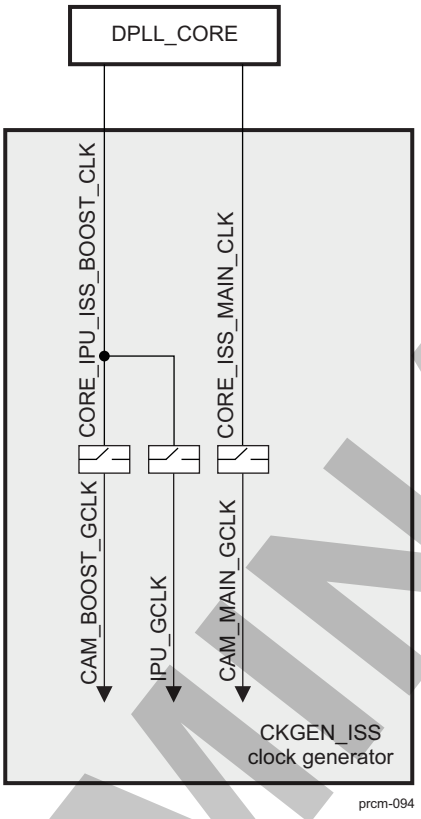
NOTE: For information about the CKGEN_ABE clock signals control and status, see Section 3.6.23, *CD_ABE Clock Domain*.

3.6.3.2.4 CKGEN_ISS Clock Generator

CKGEN_ISS receives clock signals from DPLL_CORE. It provides gated clock signals to CD_CAM and CD_IPU clock domains.

Figure 3-37 shows the various functional and interface clocks generated by CKGEN_ISS.

Figure 3-37. CKGEN_ISS Clock Manager Overview



NOTE: For clock signals control (gating/ungating management), see Section 3.1.1.1, *Clock Management*.

NOTE: For information about the CKGEN_ISS clock signals control and status, see Section 3.6.20, *CD_IPU Clock Domain*, and Section 3.6.22, *CD_CAM Clock Domain*.

3.6.3.2.5 CM_CORE Clock Generator

The CM_CORE module is in the CORE power domain. Its clock generation part generates the clock sources for all peripherals and modules besides those generated by CM_CORE_AON. It generates several functional clocks (12, 24, 48, 96, 128, 192 and 256 MHz) that feed all its peripherals and modules besides containing clock control, muxes, gating, etc. for other power domains. These clocks are constant through OPP. CM_CORE also provides a gated clock to DPLL_PER and its associated HSDivider, DPLL_USB.

GPU_SYS_CLK can be a divide by 1 or a devide by 2 version of L3 clock. This divide ration is controlled with CM_GPU_GPU_CLKCTRL[26] CLKSEL_GPU_SYS_CLK bit.

Figure 3-38 and Figure 3-39 show the various functional and interface clocks generated by CM_CORE.

Figure 3-38. CM_CORE Overview (a)

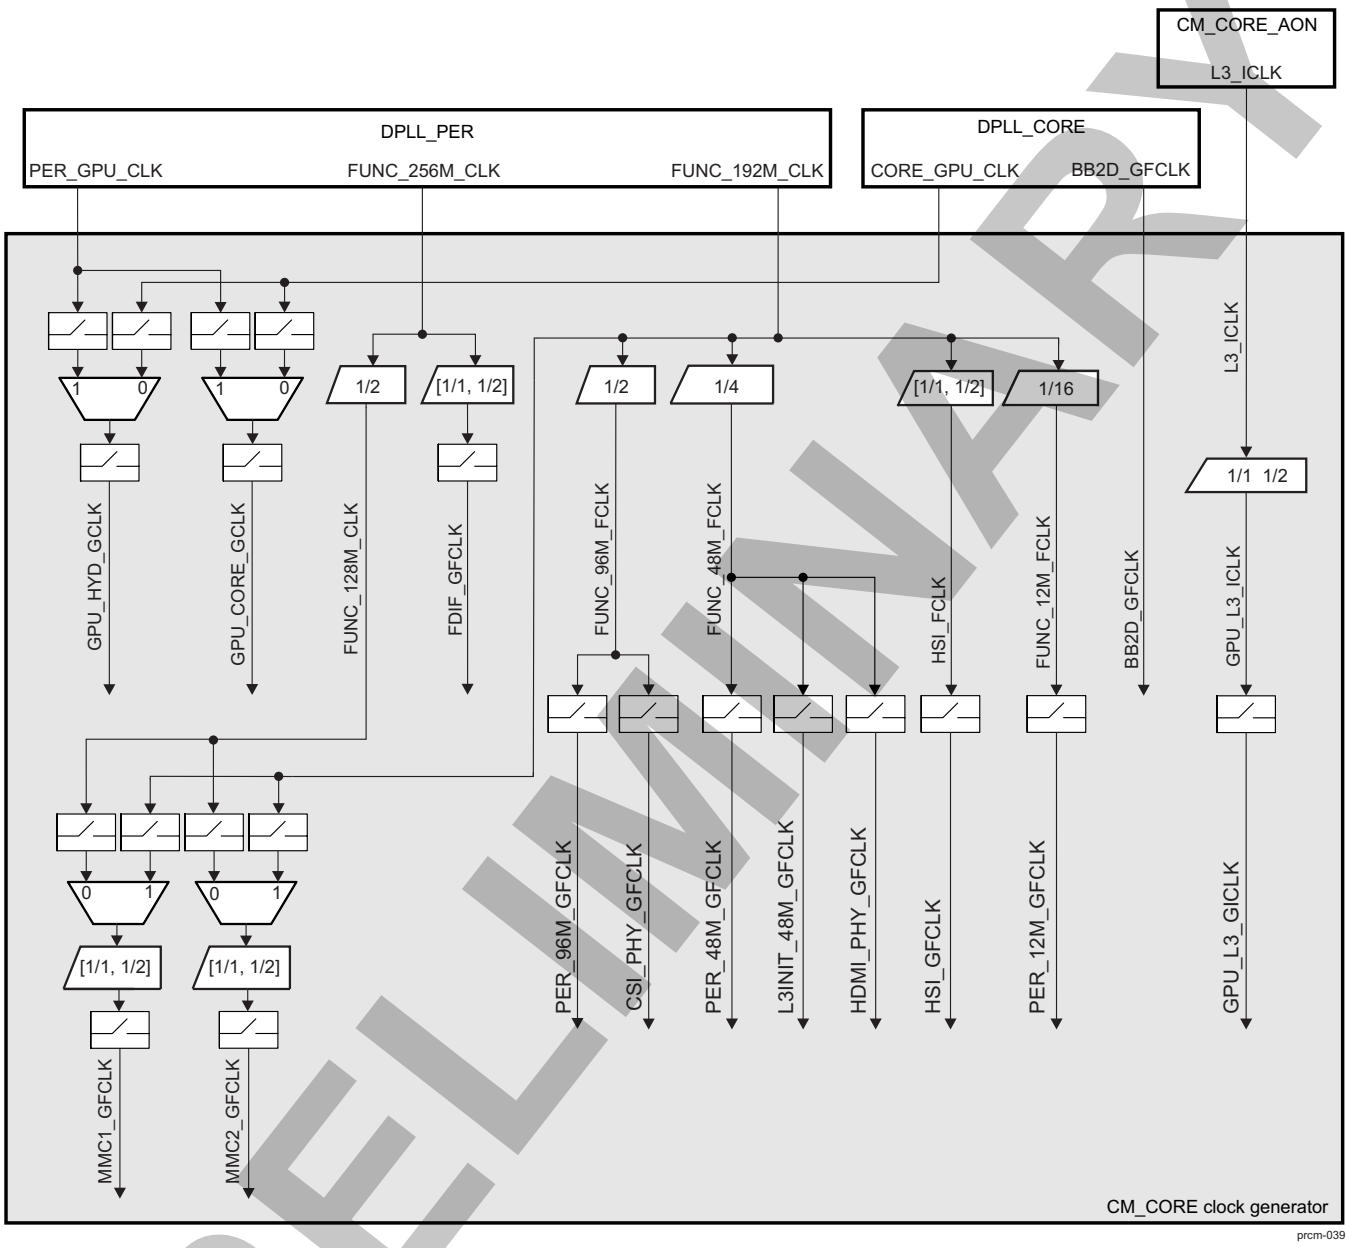


Figure 3-39. CM_CORE Overview (b)

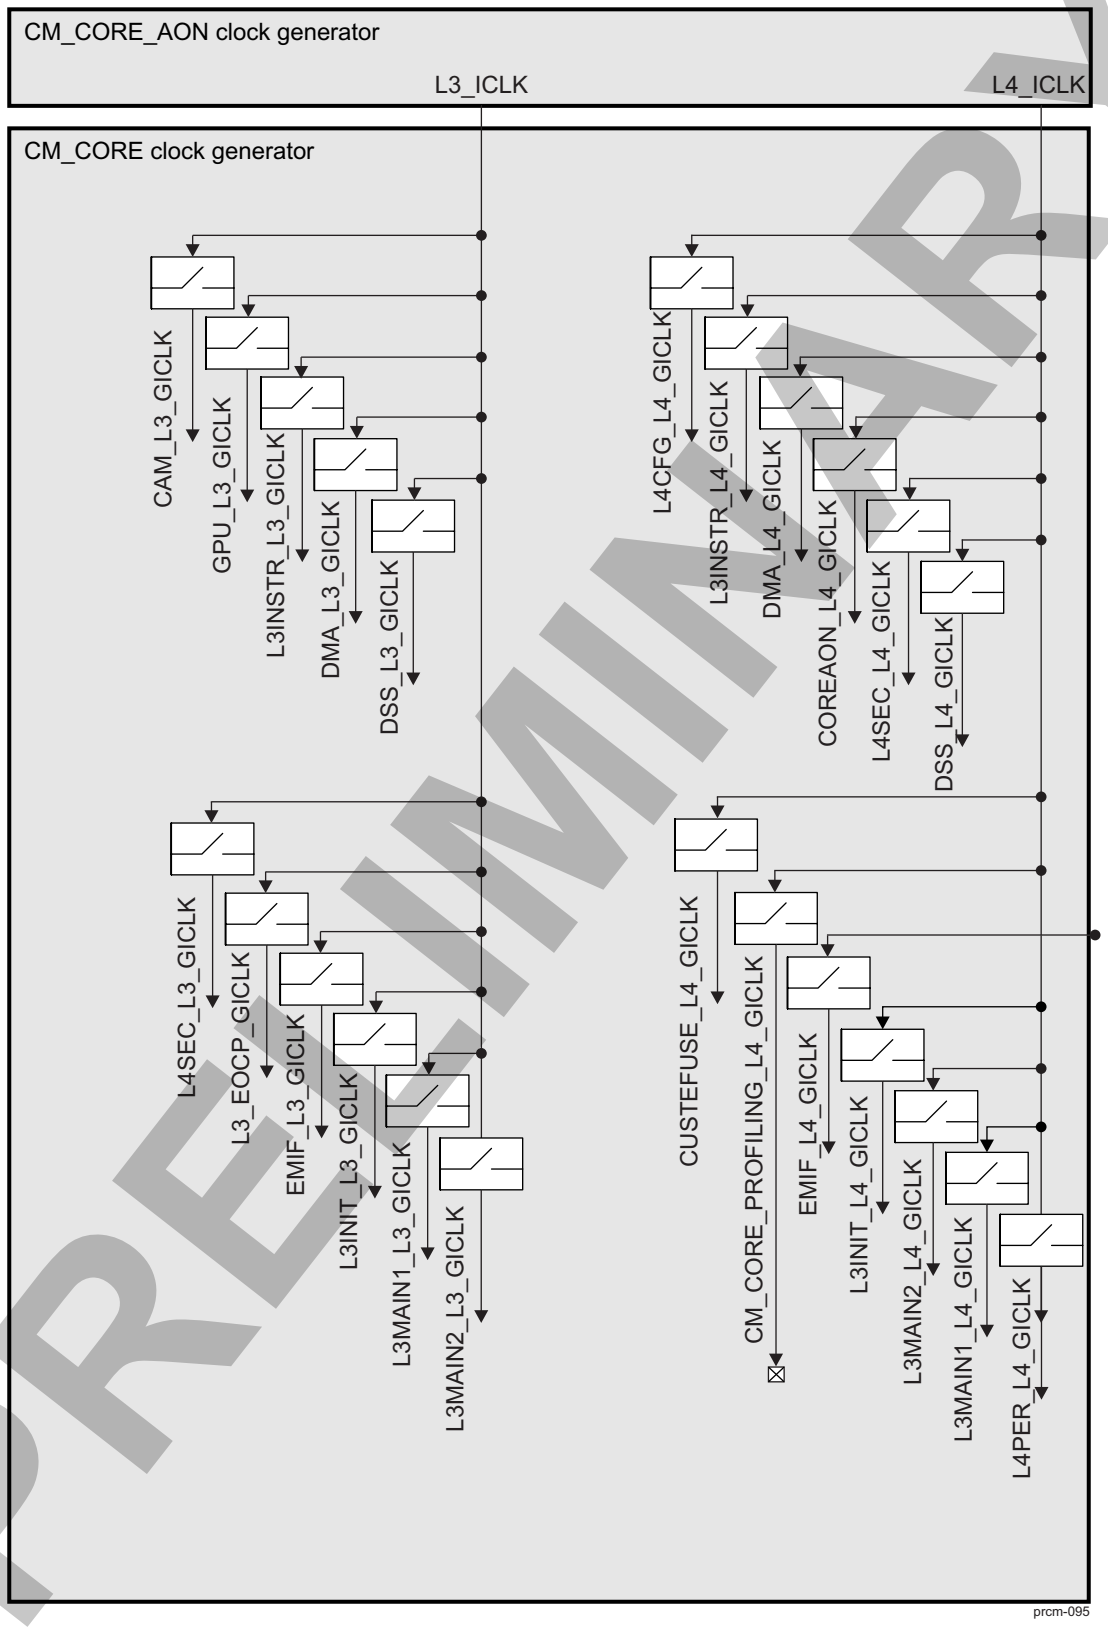

Table 3-43 identifies controls for clock dividers or muxes in the CM_CORE clock source.

Table 3-43. CM_CORE Clock Division and Muxing Control

Switch FUNC_48M_FCLK	CM_L3INIT_USB_HOST_HS_CLKCTRL[15] OPTFCLKEN_FUNC48M_CLK

NOTE: For clock signals control (gating/ungating management), see Section 3.1.1.1, *Clock Management*.

3.6.3.3 Generic DPLL Overview

To generate high-frequency clocks, the device supports multiple on-chip DPLLs controlled directly by the PRCM module. They are of two types: type A and type B DPLLs.

The following DPLLs belong to type A:

- DPLL_MPU
- DPLL_IVA
- DPLL_CORE
- DPLL_PER
- DPLL_ABE

The following DPLLs belong to type B:

- DPLL_USB

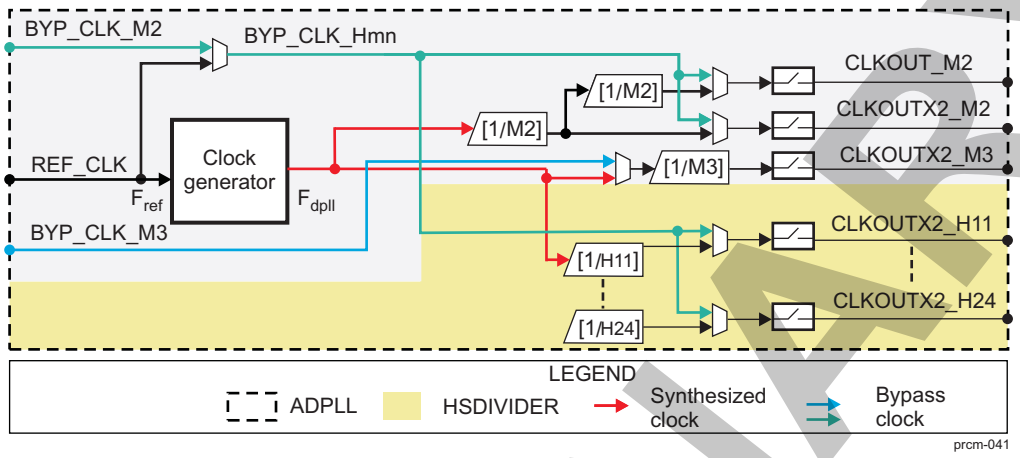
All DPLLs (type A and type B) support the features described in the following sections, unless otherwise identified.

NOTE: This chapter discusses only the DPLLs that are directly controlled by the PRCM module. The other DPLLs embedded in and managed by other subsystems are described in their respective subsystems. For example, Section 10.3.4.5, *DSI PLL Controllers,* in Chapter 10, *Display Subsystem*, discusses the DPLLs in the display subsystem.

3.6.3.3.1 DPLLs Output Clocks Parameters

Figure 3-40 shows the functional architecture of a generic DPLL.

Figure 3-40. Generic DPLL Functional Diagram



The DPLL has three input clocks:

- REF_CLK: Used to generate the synthesized clock but can also be used as the bypass clock for some outputs of the DPLL whenever the DPLL enters bypass mode. It is mandatory for the DPLL clock synthesis.
- BYP_CLK_M2: Selectable bypass clock for the output of an M2 post-divider (optional)
- BYP_CLK_M3: Selectable bypass clock for the output of an M3 post-divider (optional)

The DPLL provides the bypass clock used by HSDIVIDER: BYP_CLK_Hmn, which is output by the multiplexer between the BYP_CLK_M2 and REF_CLK clock signals.

NOTE: The [1/2] divider located after the M2 post-divider is not valid when the CM_CLKSEL_DPLL_MPU[22] DCC_EN bit is set (applies only to DPLL_MPU when a frequency higher than 1.4 GHz is needed).

The DPLL can be programmed to be locked at any frequency given by one of the following equations:

- $F_{dpll} = F_{ref} \times 2 \times M / (N + 1)$
- $F_{dpll} = F_{ref} \times 2 \times (4 \times M / (N + 1))$ in case the CM_CLKMODE_DPLL_ABE[11] DPLL_REGM4XEN bit is set (applies only to DPLL_ABE)
- $F_{dpll} = F_{ref} \times (M / (N + 1))$ in case the CM_CLKSEL_DPLL_MPU[22] DCC_EN bit is set (applies only to DPLL_MPU when frequency higher than 1.4GHz is needed).

Where:

- F_{dpll} is the DPLL lock frequency.
- F_{ref} is the REF_CLK frequency. F_{ref} is also known as CLKINP.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.

NOTE: It is preferred to minimize the value for N parameter (it minimizes lock time and jitter). Then M should be chosen to provide correct frequency (with lowest delta as possible).

It internally generates three main clocks: CLKOUT_M2, CLKOUTX2_M2, and CLKOUTX2_M3 as shown in Table 3-44.

Table 3-44. CLKOUT_M2, CLKOUTX2_M2, and CLKOUTX2_M3 Frequencies With DPLL State

Output	Equation	DPLL Mode
CLKOUT_M2	F_{dpll} / (2 x M2)	Locked (typical case)
	F_{ref} or BYP_CLK_M2	Before lock or during relock
	F_{dpll} / M2	DC corrector logic is used (DCC_EN bit is set).
CLKOUTX2_M2	F_{dpll} / M2	Locked (typical case)
	F_{ref} or BYP_CLK_M2	Before lock or during relock
	F_{dpll} / M2	DC corrector logic is used (DCC_EN bit is set).
CLKOUTX2_M3	F_{dpll} / M3 or BYP_CLK_M3/M3	Locked (typical case)
	0	Before lock or during relock
	F_{dpll} / M3 or BYP_CLK_M3/M3	DC corrector logic is used (DCC_EN bit is set).

Where:

- M2 is the software-configured division ratio binary value.
- M3 is the software-configured division ratio binary value.
- CLKOUT_M2 and CLKOUTX2_M2 bypass clock input can be switched when the DPLL is not in locked state by using the M2 bypass clock select control bit.
- CLKOUTX2_M3 output clock can be switched when the DPLL is in locked state by using the M3 clock select control bit.

NOTE:

- A value of 0 for M2 and M3 division ratios is not allowed. They are set to 1 after reset.
- CLKOUT_M2 is generated based on a fixed divide-by-2 ratio, except in bypass mode.

The DPLL can contain one or two HSDIVIDER modules to produce more clocks with divided ratio based on the DPLL synthesized clock frequency. HSDIVIDER1 provides four extra post-dividers from H11 to H14 (the output clocks are CLKOUTX2_H11 through CLKOUTX2_H14). HSDIVIDER2 provides four extra post-dividers from H21 through H24 (the output clocks are CLKOUTX2_H21 through CLKOUTX2_H24). The HSDIVIDER output clock frequency is given by the equations in Table 3-45.

Table 3-45. CLKOUTX2_Hmn Frequencies With DPLL State

Equation	DPLL Mode
CLKOUTX2_Hmn = F_{dpll} /(Hmn + 1)	Locked
CLKOUTX2_Hmn = BYP_CLK_Hmn	Before lock or during relock

Where:

- F_{dpll} is the DPLL lock frequency.
- (Hmn + 1) is the software-configured division ratio binary value.
- n is in the range from 1 to 4.
- m is equal to 1 or 2.

NOTE: Hmn + 1 division ratio is set to 1 after reset. 63 (0x3f) is an illegal value.

All clock outputs of the DPLL can be gated. The PRCM module provides the DPLL with a clock-gating control signal to enable or disable the clock. DPLL provides the PRCM module with a clock activity status signal to let the PRCM module hardware know when the clock is effectively running or effectively gated. The PRCM module provides a CM_IDLEST_DPLL_dpll_name[0] ST_DPLL_CLK status bit, which indicates the lock state or nonlock state of the DPLL.

The type B DPLL (DPLL_USB) has two outputs: CLKOUT and CLKDCOLDO. The DPLL can be programmed to be locked with the output clock frequencies given by the following equation:

- $F_{clkout} = F_{ref} \times (M / (N + 1)) \times (1 / M2)$
- $F_{clkdcoldo} = F_{ref} \times (M / (N + 1))$

Where:

- F_{clkout} is the frequency of the clock at output CLKOUT.
- $F_{clkdcoldo}$ is the frequency of the clock at output CLKDCOLDO.
- F_{ref} is the REF_CLK frequency.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.
- M2 is the software-configured division ratio binary value.

CLKOUT supports the same bypass modes as previously identified. CLKDCOLDO does not support bypass mode.

The type B DPLL output clock is synthesized by an internal oscillator that is phase-locked to the REF_CLK. Two oscillators are built within a type B DPLL. The oscillators are user-selectable based on the synthesized output clock frequency requirement. If the required frequency is greater than or equal to 1500 MHz, the user must program a value of 1 in the CM_CLKSEL_DPLL_dpll_name[21] DPLL_SELFREQDCO bit. This drives a value of 100 on the SELFREQDCO input of the corresponding type B DPLL. If the required frequency is less than 1500 MHz, the user must program a value of 0 in the CM_CLKSEL_DPLL_dpll_name[21] DPLL_SELFREQDCO bit. This drives a value of 010 on the SELFREQDCO input of the corresponding type B DPLL.

3.6.3.3.2 Enable Control, Status, and Low-Power Operation Mode

The DPLL has a manual mode control bit field, which allows the setting of the different operating modes of the DPLL. When the DPLL is switched to lock mode, the current values of the multiplication ratio (M) and the division ratio (N) are latched in the DPLL. The DPLL then starts the lock or relock sequence to synthesize the corresponding output frequency clock.

The status of the synthesized clock output of the DPLL is represented by the CLKOUT status bit. It can be gated or active.

The type A DPLLs can be switched to low-power operation mode (also called LPMODE) to optimize DPLL power consumption when the input and output clock frequencies are low. This mode can be software-enabled using the low-power mode control bit of the DPLL.

It must be enabled only if both of the following operating conditions are satisfied:

- $F_{ref} / (N + 1)$ is less than or equal to 1 MHz.
- $F_{ref} \times M / (N + 1)$ is less than or equal to 100 MHz.

Where:

- F_{ref} is the REF_CLK frequency.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.

3.6.3.3.3 DPLL Power Modes

DPLL supports several power modes for type A and only one power mode for type B. Each mode results in a tradeoff between power savings and relock time. The PRCM module allows only a few modes for each DPLL, depending on the use of the DPLL.

Table 3-46 lists the DPLL power modes.

Table 3-46. DPLL Power Modes

Power Mode	CLKOUT State	Logic Current (mA)	Analog Current (mA)	Freq Lock Time	Phase Lock Time
Low-power stop	Clock stopped	0.065 (leakage)	0.009 (leakage)	2.5 µs + (70 × (N+1) / F_{ref})	2.5 µs + (120 × (N+1) / F_{ref})
Fast-relock stop	Clock stopped	0.065 (leakage)	0.009 (leakage)	2.5 µs + (70 × (N+1) / F_{ref})	2.5 µs + (120 × (N+1) / F_{ref})
Low-power bypass	Bypass clock/clock stopped	0.065 (leakage)	0.009 (leakage)	2.5 µs + (70 × (N+1) / F_{ref})	2.5 µs + (120 × (N+1) / F_{ref})
Fast-relock bypass	Bypass clock/clock stopped	0.065 (leakage)	0.5 (leakage)	0.05 µs + (70 × (N+1) / F_{ref})	0.05 µs + (120 × (N+1) / F_{ref})
Lock	Synthesized clock	0.95 (active)	3 (active)	N/A	N/A

Where:

- F_{ref} is the REF_CLK frequency.

A DPLL power mode can be achieved on a software request (manual) and/or automatically (automatic), depending on the specific hardware conditions.

A DPLL can switch from one mode to another as a result of the following:

- Software-programmed transition (manual): Software configures the dedicated DPLL manual mode control feature for the next desired DPLL mode. It must ensure that the transition can be performed based on the clock activity on the device.
- Combined software-programmed and hardware-conditions-based transition (auto): This mode allows the DPLL to automatically transition to a low-power state (that is, any state other than the LOCK state) when the output clocks are gated or the destination clock domain is inactive, and to switch back to the LOCK state when the output clock is needed (that is, the clock is ungated or the clock domain becomes active). The desired low-power state for the automatic transition is configured in the dedicated Auto Mode Control parameter of the DPLL.

NOTE: With T_{ref} = 1 / F_{ref} = (N + 1) / CLKINP; (Fref = CLKINP / (N + 1)):

$T_{ref}$is the REF_CLK period.

This formula indicates that a smaller N divider value provides a smaller time for switching the clock after an M2 post-divider change.

A compromise is necessary between the clock switching latency and power consumption. Having a smaller N value:

- Requires a higher M2 post-divider value to obtain the same target frequency.
- Results in a higher DPLL lock frequency, and then higher power consumption.

NOTE:

- A manual transition can be performed from any power mode to any other power mode.
- An automatic transition can be performed from lock mode to any low-power mode.

NOTE: When the DPLL is in Low-power bypass mode, Auto-idle mode is disabled and no clock is requested, the DPLL makes a transition to Low-power stop mode. Thus the device can switch off even if the DPLL is set to Low-power bypass mode.

3.6.3.3.4 DPLL Recalibration

The DPLL recalibration applies only to type-A DPLLs. Each time the DPLL is reset or performs a lock sequence (following a change in the value of multiplier M or divider N), it performs a recalibration of the output frequency, based on voltage and temperature conditions. In lock mode, the DPLL maintains a steady lock frequency output by compensating for voltage and temperature changes within a certain range. However, if the voltage or temperature drifts outside the range or shows a significant or fast change, the DPLL may not be able to track and compensate it. It would need a recalibration, which is signaled by assertion of a recalibration flag.

NOTE:

- The recalibration mechanism is active only while the DPLL is in lock mode. When the DPLL is in off or bypass mode (low-power or fast-relock), it does not assert the recalibration flag.
- If the DPLL drifts out of the operating range limits while not locked, and then when it tries to relock, it fails to lock within the normal delay and recalibrates automatically before eventually locking. The only difference between this case and a standard relock is the recalibration delay.

During recalibration, the DPLL loses lock and output clock switches to the bypass clock.

The DPLL can automatically start recalibration when the recalibration flag is asserted, or recalibration can be triggered by software control. The trigger setting of the recalibration can be configured by the corresponding registers of the DPLL in the PRCM module. The software-controlled recalibration mode is selected by default.

Software-controlled recalibration: The DPLL continues its tracking mechanism as long as the recalibration is not triggered by software (that is, by enabling the recalibration-enable control parameter). If the DPLL reaches upper or lower bounds of the DCO control code and software has still not triggered recalibration, the DPLL stops its tracking mechanism. The output clock remains active, but frequency and jitter are not ensured to meet the requirement.

Automatic recalibration: The DPLL immediately starts the recalibration as soon as the recalibration flag is asserted.

NOTE: Automatic recalibration of the DPLL can start at any time. While relocking, the DPLL switches to bypass mode, which introduces a frequency change. For modules that are sensitive to frequency change while operating, this can introduce operational instability. For example, the external memory EMIF controller is sensitive to a frequency change on the DPLL because its embedded DLL relocks on a frequency change. Any EMIF access during this DLL relock period can be corrupted. It is, therefore, important to stall EMIF access during DPLL recalibration.

To allow software to recalibrate the DPLL at the correct time depending on the device activity, the PRCM module can generate a wake-up event on the processor power domain, followed by an interrupt on the processor subsystem when the DPLL recalibration flag is asserted.

Table 3-47 lists the DPLL recalibration and control parameters.

Table 3-47. DPLL Recalibration Control Parameters

Parameter	Register	Description
Recalibration-enable control	CM_CLKMODE_DPLL_<module>[8] DPLL_DRIFTGUARD_EN	Enable/disable the DPLL automatic recalibration feature.
Recalibration-interrupt mask control	PRM_IRQENABLE_MPU PRM_IRQENABLE_IPU PRM_IRQENABLE_DSP	Mask/unmask the DPLL recalibration interrupt to processor.
Recalibration-interrupt status	PRM_IRQSTATUS_MPU PRM_IRQSTATUS_IPU PRM_IRQSTATUS_DSP	Status of the DPLL recalibration interrupt to processor

3.6.3.3.5 DPLL Spread Spectrum Clocking

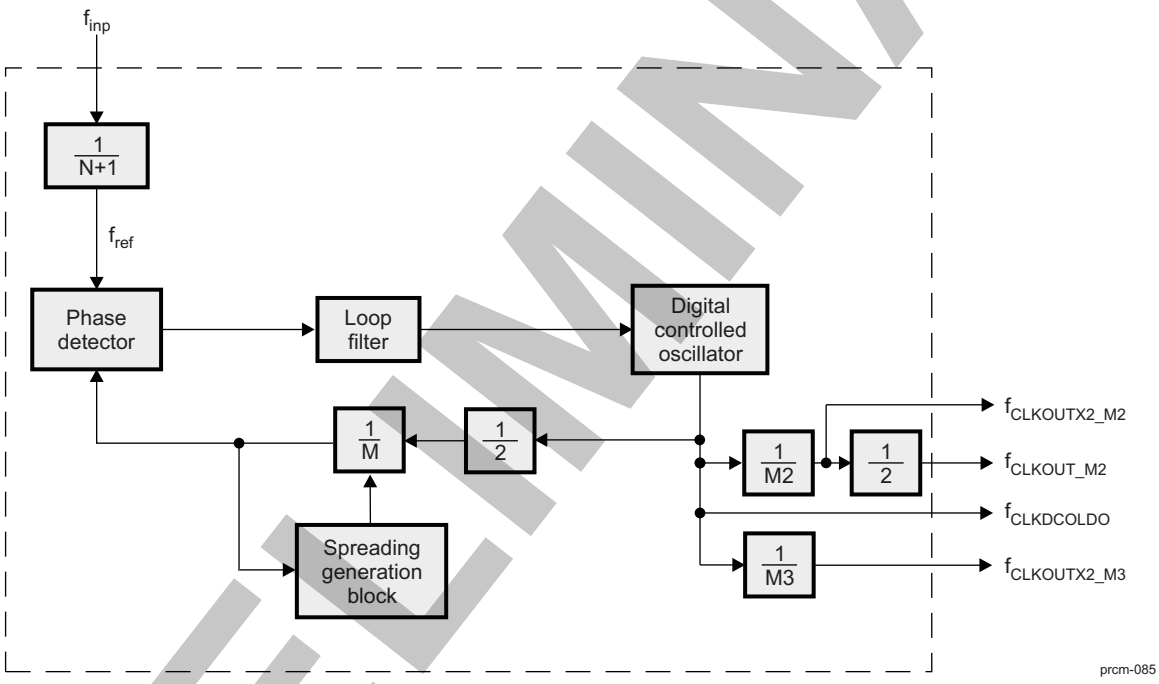
The synthesized clock output of the DPLL has a stable frequency. This periodicity generates a significant power peak at the selected frequency, which in turn causes an electromagnetic interference (EMI) disturbance to the environment. In communication devices, this clock signal generates unwanted spurious signals that interfere with the decoding of information received. It results in performance degradation; for example, in the form of high bit-error rates in case of a wireless communication interface.

To reduce the power peaks (and the electromagnetic noise generated at a specific frequency), an internal frequency modulation of the DPLL is used to distribute the energy to many different frequencies, thereby reducing the power peaks. This is called spread spectrum clocking (SSC). DPLL supports triangular SSC.

SSC in the DPLL is performed by changing the feedback divider (M) in a triangular pattern. This varies the frequency of the output clock in a triangular pattern. The frequency of this pattern is the modulation frequency (fm). It is programmed as a ratio of the REF_CLK/4. This frequency modulation feature is directly integrated into some DPLLs of the device.

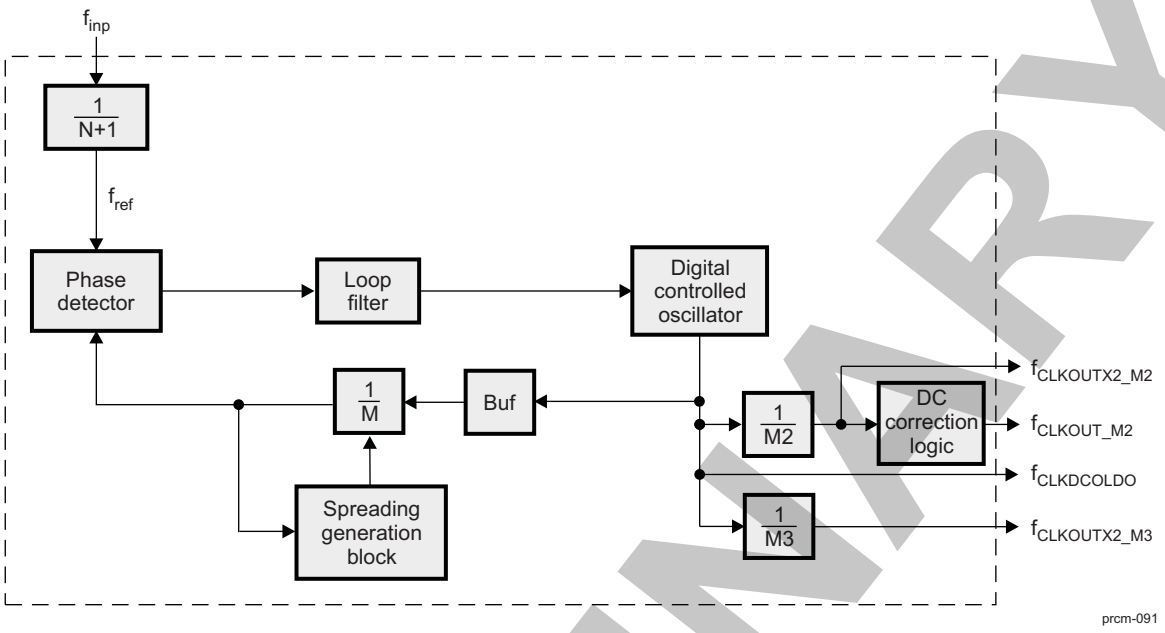
shows a diagram of a type A DPLL that supports the SSC feature with DC correction logic disable.

Figure 3-41. Type A DPLL With SSC Reduction Feature and DC correction logic disable



shows a diagram of the DPLL_MPU that supports the SSC feature with DC correction logic enable.

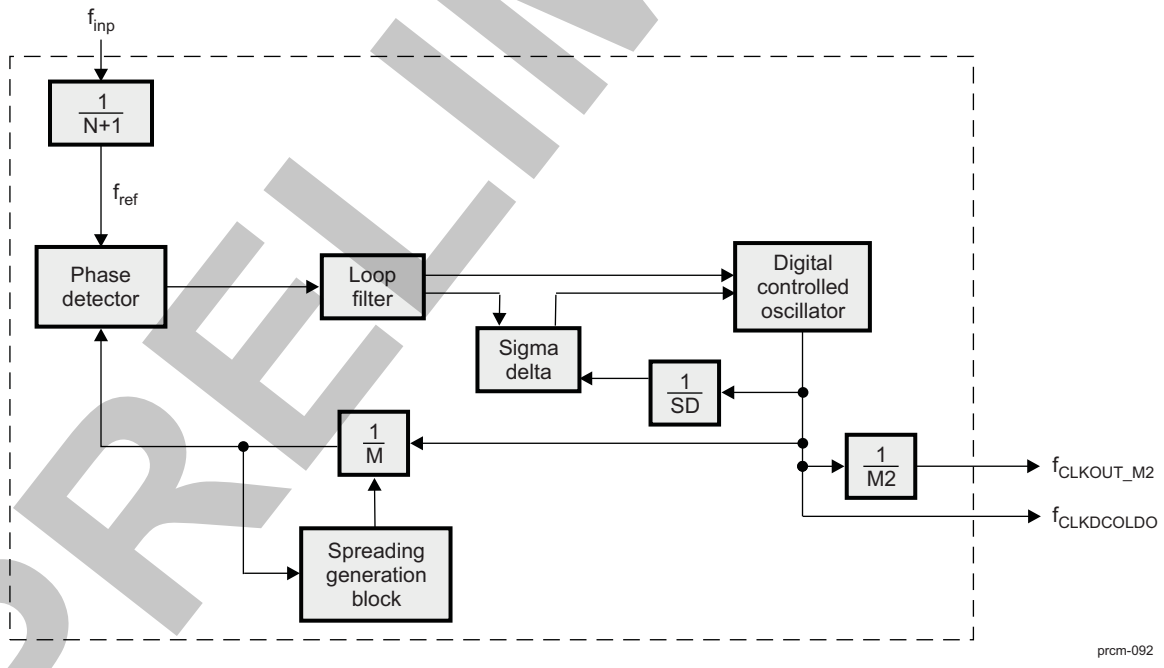
Figure 3-42. DPLL_MPU With SSC Reduction Feature and DC correction logic enable



NOTE: The M2 post divider value should be set to 0x1 before enabling DC correction logic.

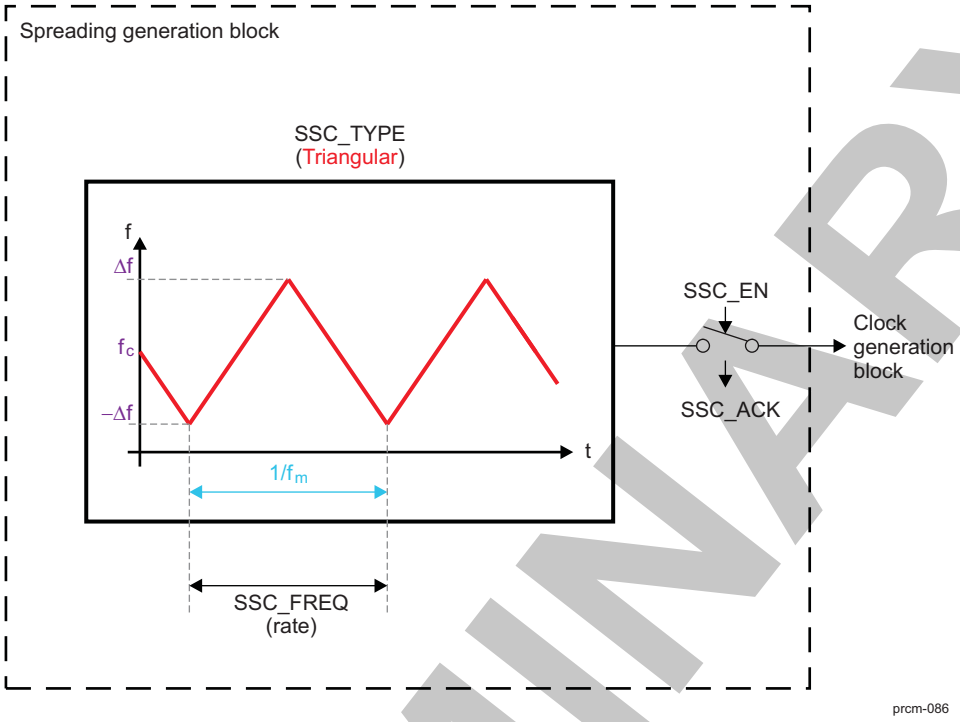
shows a diagram of a type B DPLL that supports the SSC feature.

Figure 3-43. Type B DPLL With SSC Reduction Feature



shows a diagram of the spreading generation block.

Figure 3-44. Spreading Generation Block Diagram



NOTE: Δf is the deviation from the center frequency. The total spreading deviation is equal to twice Δf. The peak (ΔM) or the amplitude of the triangular/square pattern as a percent of M would be equal to the percent of the frequency spread (Δf), $\Delta M/M = \Delta f/f_c$.

f_c is the original output clock frequency.

f_m is the spreading frequency.

This additional block generates the required waveform used to reduce EMI. This waveform is then modulated with the initial signal to add some controlled deviation to the clock signal frequency, which spreads the energy of the clock and its harmonics into a band of frequencies, and then reduces EMI. SSC_DOWNSPREAD can control the position of the generated signal. It is controlled by the CM_CLKMODE_DPLL_<module>[14] DPLL_SSC_DOWNSPREAD bit of the corresponding registers (where <module> is the name of the concerned DPLLs). If the DOWNSPREAD bit is set to 1, the frequency spread on the lower side is twice the programmed value. The frequency spread on the higher side is 0.

The value of SSC_FREQ controls the rate of the generated signal. It can be programmed as a ratio of the reference clock: $f_{ref}/4$. The value that must be programmed is calculated as follows:
$ModFreqDivider = f_{ref}/(4 \times f_m)$, where $f_m < f_{ref}/70$, $f_{ref} = f_{inp}/(1+N)$, and f_{inp} is the input clock for the DPLL.
The ModFreqDivider is split into mantissa and exponent: $ModFreqDivider = Mantissa \times 2^{Exponent}$
The same value of ModFreqDivider can be obtained by different combinations of mantissa and exponent values. However, it is recommended to set the target ModFreqDivider by programming a maximum mantissa and a minimum exponent. This is controlled by the CM_SSC_MODFREQDIV_DPLL_<module>[10:8] MODFREQDIV_EXPONENT and CM_SSC_MODFREQDIV_DPLL_<module>[6:0] MODFREQDIV_MANTISSA bit fields of the corresponding registers (where <module> is the name of the concerned DPLL).
To define the modulation-frequency divider step size (ΔM) for triangular SSC, a DeltaMStep parameter must be programmed. DeltaMStep is split into integer and fractional parts. The step size can be calculated as follows:
ΔM = ModFreqDivider × DeltaMStep, if Exponent ≤3
ΔM = 8 × Mantissa × DeltaMStep, if Exponent > 3

It is controlled by the CM_SSC_DELTAMSTEP_DPLL_<module>[19:0] DELTAMSTEP bit field of the corresponding register (where <module> is the name of the concerned DPLL). The CM_SSC_DELTAMSTEP_DPLL_<module>[19:18] bit field defines the integer part, while the CM_SSC_DELTAMSTEP_DPLL_<module>[17:0] bit field defines the fractional part.
The SSC_EN signal enables and disables the frequency modulation feature of the DPLL. It is controlled by the CM_CLKMODE_DPLL_<module>[12] DPLL_SSC_EN bit of the corresponding registers (where <module> is the name of the concerned DPLL).
The SSC_ACK signal notifies of the exact start and SSC end of the DPLL. It can be read by the CM_CLKMODE_DPLL_<module>[13] DPLL_SSC_ACK bit of the corresponding registers (where <module> is the name of the concerned DPLL).
The following restriction applies to the range of M values: M – ΔM should be ≥ 20. Also, M+ΔM should be ≤ 2045. If DOWNSPREAD is enabled, M – 2 × ΔM should be ≥ 20, and M ≤ 2045. In any case, the frequency modulation is programmed and it is not generally something that must be changed in real time.

describes the DPLL SSC control parameters.

Table 3-48. DPLL SSC Control Parameters

Parameter	Register	Description
SSC enable control	CM_CLKMODE_DPLL_<module>[12] DPLL_SSC_EN	Enable/disable the DPLL SSC feature. When set to disable, SSC is disabled only after completion of one full cycle of the modulation pattern to maintain the average frequency.
SSC acknowledge	CM_CLKMODE_DPLL_<module>[13] DPLL_SSC_ACK	Notifies the exact start and end of SSC
Modulation frequency divider setting (Mantissa and Exponent)	CM_SSC_MODFREQDIV_DPLL_<module>[6:0] MODFREQDIV_MANTISSA CM_SSC_MODFREEQDIV_DPLL_<module>[10:8] MODFREQDIV_EXPONENT	Set the ratio of the modulation frequency with respect to the REF_CLK/4 frequency.
M step size setting (DeltaMStepInteger and DeltaMStepFraction)	CM_SSC_DELTAMSTEP_DPLL_<module>[19:0] DELTAMSTEP	Set the feedback divider variation step-size.

3.6.3.3.5.1 Definition

The aim of the SSC is to add a variation to the frequency of an original clock, which spreads the generated interference over a larger band of frequencies.
In theory, SSC means that the clock signal is varied around the desired frequency. For example, for a 1 GHz clock, the frequency might be 999.5 MHz at one time and 1.0005 GHz at another. Doing this constantly causes the power of the tone to be spread out more over a broader band of tight frequencies (centered at the desired tone). To realize this constant variation on the original signal, a modulation with an additional signal (called spreading waveform) is realized.
Creating an SSC by spreading the initial clock frequency is done by defining the following parameters:

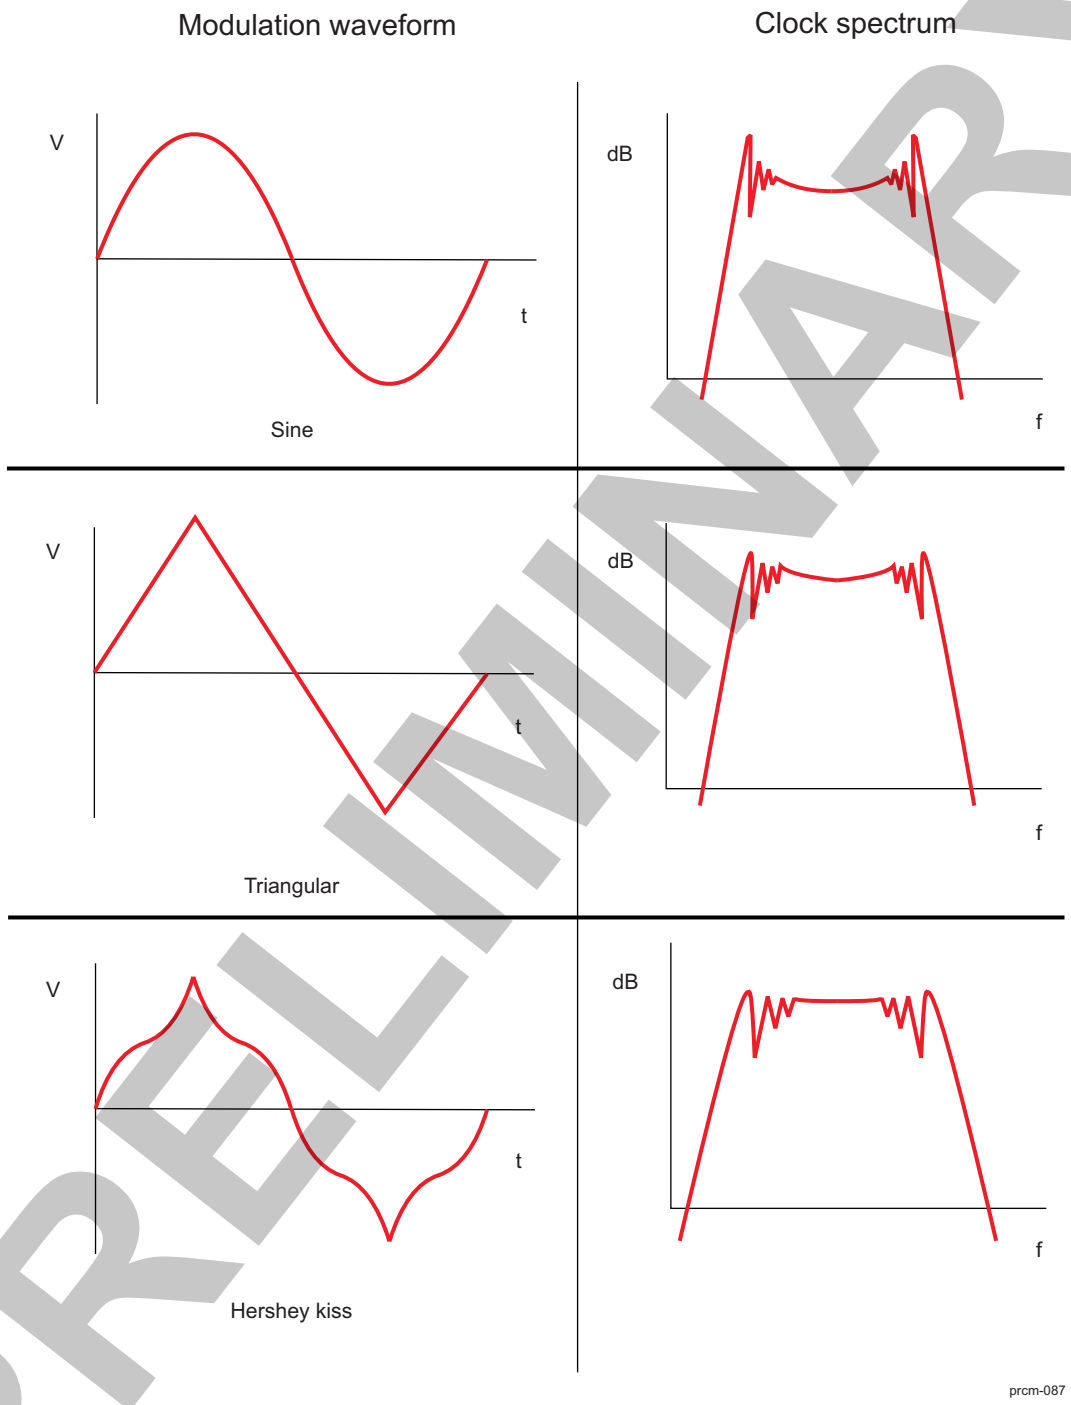
- The spreading frequency (deviation), which is the ratio of the range of spreading frequency over the original clock frequency
- The modulation rate (f_m), which is used to determine the clock-frequency spreading-cycling rate, and is the time during which the generated clock frequency varies through f and returns to the original frequency
- The modulation waveform, which describes the variation curve over time The spectral power reduction in the DPLL clocks is dependent on the modulation index (K), which is a ratio of spreading frequency, calculated from the frequency deviation (f) and the modulation rate (f_m).

3.6.3.3.5.2 Modulation Waveforms

The shape (profile) of the generated clock signal depends on the modulation waveform that is used during the frequency modulation. Several profiles can be used, according to the desired shaping for the energy spreading.

shows three examples of modulation waveforms and the spectrum of the corresponding modulated clock signal.

Figure 3-45. Modulation Profiles

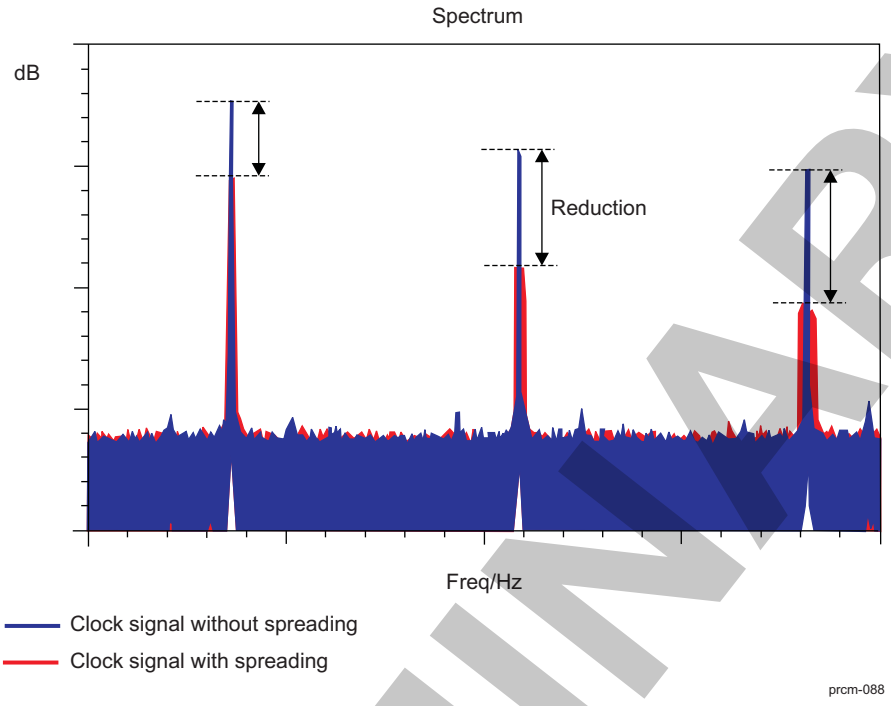


The triangular wave gives a relatively flat spectrum and is also easy to generate.

3.6.3.3.5.3 Effects on the Clock Signal

shows an example of the effect of triangular spreading on a clock signal.

Figure 3-46. Effect of the SSC in Frequency

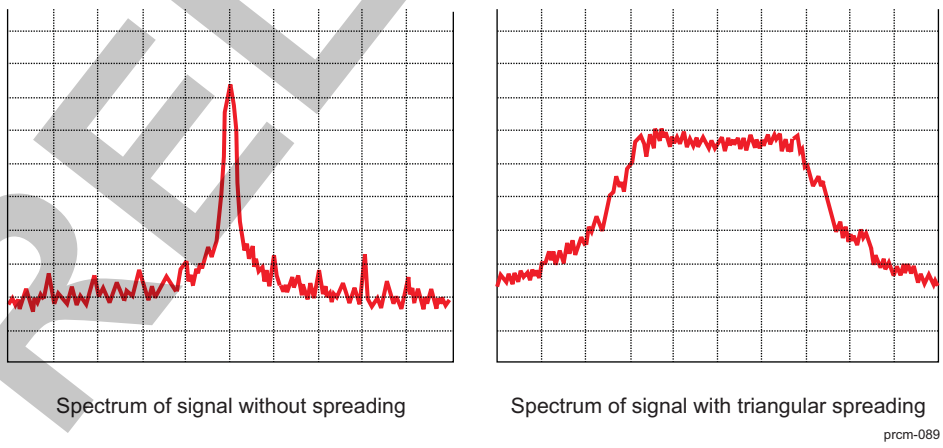


highlights the power reduction of the main peak, but also the flatter aspect of the modulated signal. Notice that the minimum level of the second signal is higher than the first one. This effect is normal and is due to the noise added for the modulation.

NOTE: The spreading technique scatters the energy of the peaks on the other frequencies, which reduces the power of the peaks but increases the global noise of the signal.

shows the effect of triangular spreading on a clock signal in the time domain.

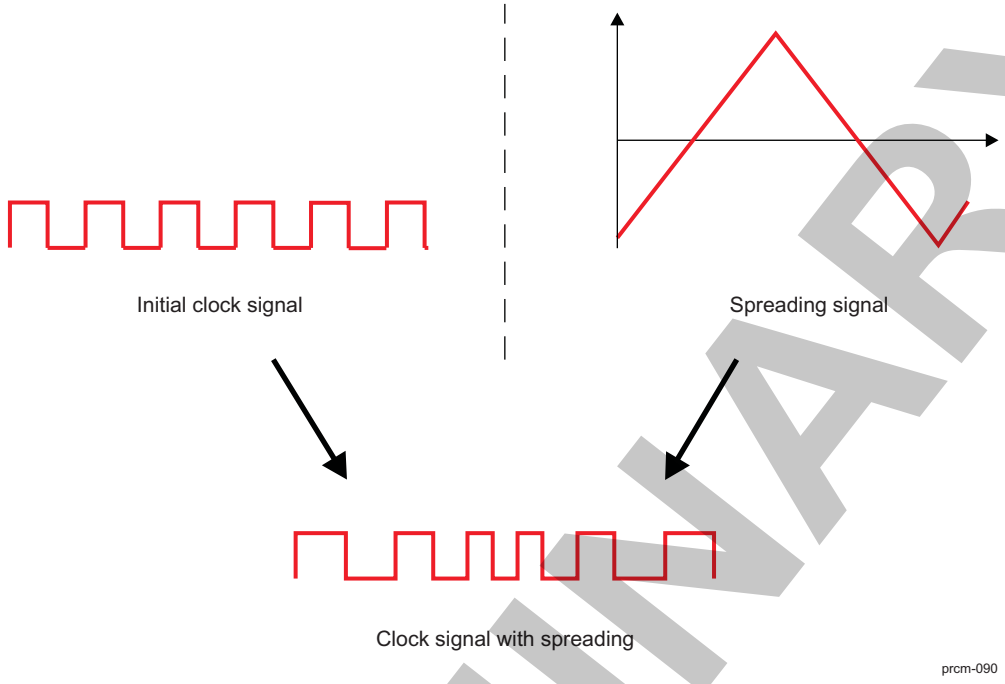
Figure 3-47. Effect of the SSC in the Time Domain



3.6.3.3.5.4 Estimation of the EMI Reduction Level

shows the effect of spreading on a clock and its harmonics.

Figure 3-48. Peaks Reduction Due to Spreading



Electromagnetic interference (EMI) reduction can be estimated using the following equation:
(1) Peak_power_reduction = 10 × log ((Deviation × f_c)/f_m) – 10
Where:

- Peak_power_reduction in dB
- Deviation in percentage of the initial clock frequency (f_c), is equal to $\Delta f/f_c$
- f_c is the original clock frequency, in MHz
- f_m is the spreading frequency, in MHz

  According to equation (1), the deviation can also be calculated, and then f for a required reduction in peak-power:
  (2) Deviation = (f_m/f_c) × $10^{((Peak\_power\_reduction + 10)/10)}$
  Example:
  For f_c = 160 MHz, Deviation = 1% peak from f_c (Δf = 1.6 MHz) and f_m = 16 kHz, the estimated peak power reduction is 10 dB.

3.6.3.3.5.5 Bandwidth Calculation (Carson's Bandwidth Rule)

Carson's bandwidth rule defines the approximate bandwidth requirements of communications system components for a carrier signal that is frequency modulated by a continuous or broad spectrum of frequencies, rather than by a single frequency.

Carson's bandwidth rule is expressed by the relation CBR = 2 × (f + f_m), where CBR is the bandwidth requirement, f is the peak frequency deviation, and f_m is the highest frequency in the modulating signal. For example, an FM signal with a 5-kHz peak deviation, and a maximum audio frequency of 3 kHz, would require an approximate bandwidth 2 × (5 + 3) = 16 kHz.

Theoretically, any FM signal has an infinite number of sidebands and, hence, an infinite bandwidth. In practice, all significant sideband energy (98 percent or more) is concentrated within the bandwidth defined by Carson's bandwidth rule.

3.6.3.3.5.6 SSC Configuration

The configuration of the spreading feature is not mandatory when programming the DPLL. This feature is usually enabled when the DPLL clocks generate harmonics, which can potentially interfere with the GSM carrier frequencies.

Once the clock generation control registers are configured, the spreading on the clock signal can be configured as follows:

1. Calculate ModFreqDivider and DeltaMStep based on the desired peak-power reduction.
2. Configure the MODFREQDIV_EXPONENT, MODFREQDIV_MANTISSA, and DELTAMSTEP bit fields according to the calculated values.
3. Enable the spreading using the DPLL_SSC_EN bit.

NOTE: Spreading on a clock must be carefully configured to avoid adding noise on frequencies that are used by another module. For example, adding spreading on a clock to reduce noise on GSM frequencies can move the generated noise to the frequency of the memory controller and thus degrade its performance.

Example:
For f_c = 160 MHz, Deviation = 1% peak from f_c (Δf = 1.6 MHz) and f_m = 16 kHz, the estimated peak power reduction is 10 dB.
The output clock can be calculated using the following equation: $f_c = (f_{inp} \times M)/((N + 1) \times M2)$ (where M is a software-controlled multiplier, N is software-controlled divider, M2 is software-controlled output divider, f_c stands for f_{CLKOUT_M2}, for other output clock frequencies calculation and more information see section Section 3.6.3.3.1 *DPLLs Output Clocks Parameters* and the Clock Tree Tool).

The input clock is f_{inp} = 38.4 MHz. The following settings of the DPLL are required to have f_c = 160 MHz: M = 25, N = 2, M2 = 2. The value of M satisfies the restrictions: M – ΔM > = 20. Also, M + ΔM < = 2045.
f_{ref} can be calculated using the following equation: $f_{ref} = f_{inp}/(1 + N)$ = 12.8 MHz
ModFreqDivider can be calculated using the following equation: $ModFreqDivider = f_{ref}/(4 \times f_m)$ = 200
The exponent and mantissa of ModFreqDivider can now be calculated (where ModFreqDivider = Mantissa $\times 2^{Exponent}$ and it must be used as the minimal value for the exponent): Mantissa = 100, Exponent = 1
Knowing the deviation and M, ΔM can now be calculated: $\Delta M/M = 1\% \geq \Delta M = 0.01 \times 25 = 0.25$
DeltaMStep can be calculated as follows: DeltaMStep = ΔM/ModFreqDivider = 0.00125
The integer and fractional part of DeltaMStep can now be determined: Integer part = 0, Fractional part = $0.00125 \times 2^{18} = 327$ (for an 18-bit fractional part)
The DPLL can be configured as follows:

- MODFREQDIV_EXPONENT = 1
- MODFREQDIV_MANTISSA = 100
- DELTAMSTEP = 327

  The state of the modulation feature can be monitored with the DPLL_SSC_ACK bit of the corresponding register.

NOTE: Because this is in-band modulation for the DPLL, the modulation frequency must be within the DPLL loop bandwidth ($f_m < f_{ref}/70$). A higher modulation frequency would result in less spreading in the output clock.

When deactivating the spreading (DPLL_SSC_EN = 0), the end-of-spreading is synchronous to the internal spreading cycle. Thus, there is no residual average frequency error.

3.6.3.3.6 DPLL Output Power Down

The DCO clock LDO (DCOCLKLDO) of the DPLL can be powered down if all output dividers of the DPLL are powered down. The PRCM module automatically reenables the power to the LDO when an output divider is powered up or the DPLL switches to bypass mode.

Table 3-49. DPLL Power-Down Control Parameters

Parameter	Description
DCO clock LDO power down control	Enable/disable automatic power-down feature if all output dividers are powered down.

3.6.3.4 DPLL_PER Description

3.6.3.4.1 Overview

Figure 3-49 is an overview of the DPLL. For a functional overview of a generic DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

CLKOUTX2_H23	Divider control	CM_DIV_H23_DPLL_CORE[5:0] DIVHS
CLKOUTX2_H24	Status	CM_DIV_H24_DPLL_CORE[9]CLKST
CLKOUTX2_H24	Divider control	CM_DIV_H24_DPLL_CORE[5:0]DIVHS

3.6.3.5.3 Power Modes

This section identifies the operating modes supported by the DPLL and the control bit fields to set its operating modes. For an explanation of the DPLL operating modes and associated control and status features, see Section 3.6.3.3.2, *Enable Control, Status, and Low-Power Operation Mode,* and Section 3.6.3.3.3, *DPLL Power Modes*.

Table 3-58 lists the operating modes supported by the DPLL.

Table 3-58. DPLL_CORE Modes

Low-Power Stop	Fast-Relock Stop	Low-Power Bypass	Fast-Relock Bypass	Lock
Not available	Not available	Available	Available	Available

Table 3-59 lists the control bit fields for the operating mode control of the DPLL.

Table 3-59. DPLL_CORE Mode Control Parameters

Parameter Name	Control Bit Field
Low-Power Mode Control	CM_CLKMODE_DPLL_CORE[10] DPLL_LPMODE_EN
Manual Mode Control	CM_CLKMODE_DPLL_CORE[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_CORE[2:0] AUTO_DPLL_MODE

3.6.3.5.4 Recalibration

Table 3-60 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. For an explanation of the DPLL recalibration feature, see Section 3.6.3.3.4, *DPLL Recalibration*.

Table 3-60. DPLL_CORE Recalibration Feature Parameters

Parameter Name	Control/Status Bit Field
Recalibration – Enable Control	CM_CLKMODE_DPLL_CORE[8] DPLL_DRIFTGUARD_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_MPU[0] DPLL_CORE_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_MPU[0] DPLL_CORE_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_IPU[0] DPLL_CORE_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_IPU[0] DPLL_CORE_RECAL_EN

3.6.3.5.5 Spread Spectrum Clocking

Table 3-61 lists the control bit fields associated with the SSC features of the DPLL. For an explanation of the DPLL SSC feature, see Section 3.6.3.3.5, *DPLL Spread Spectrum Clocking*.

Table 3-61. DPLL_CORE Spread-Spectrum Clocking Feature Parameters

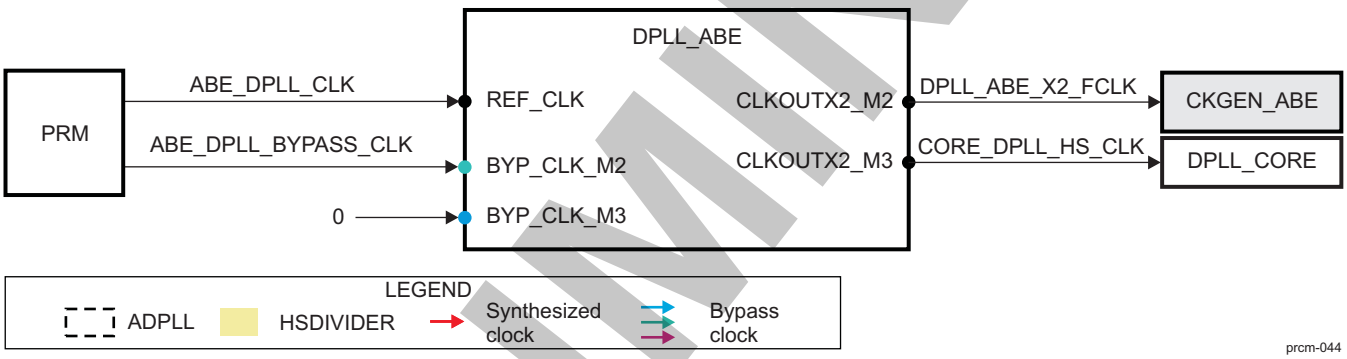
Parameter Name	Control Bit Field
SSC Downspread	CM_CLKMODE_DPLL_CORE[14] DPLL_SSC_DOWNSPREAD
SSC Acknowledge	CM_CLKMODE_DPLL_CORE[13] DPLL_SSC_ACK
SSC Enable Control	CM_CLKMODE_DPLL_CORE[12] DPLL_SSC_EN
Modulation Step Size Setting	CM_SSC_DELTAMSTEP_DPLL_CORE[19:0] DELTAMSTEP
Modulation Frequency Divider – Exponent	CM_SSC_MODFREQDIV_DPLL_CORE[10:8] MODFREQDIV_EXPONENT
Modulation Frequency Divider – Mantissa	CM_SSC_MODFREQDIV_DPLL_CORE[6:0] MODFREQDIV_MANTISSA

3.6.3.6 DPLL_ABE Description

3.6.3.6.1 Overview

Figure 3-51 is an overview of the DPLL. For a functional overview of a generic DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Figure 3-51. DPLL_ABE Overview



3.6.3.6.2 Synthesized Clock Parameters

This section describes the clock synthesis and clock-out divider parameters of the DPLL. For an explanation of the clock synthesis and output divider parameters of the DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Table 3-62 lists the clock synthesis parameters of the DPLL.

Table 3-62. DPLL_ABE Clock Synthesis Parameters

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_ABE[18:8] DPLL_MULT
N	CM_CLKSEL_DPLL_ABE[6:0] DPLL_DIV
REGM4XEN	CM_CLKMODE_DPLL_ABE[11] DPLL_REGM4XEN

Table 3-63 lists the clock output divider parameters of the DPLL.

Table 3-63. DPLL_ABE Clock Output Parameters

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUTX2_M2	Status	CM_DIV_M2_DPLL_ABE[11] CLKX2ST
CLKOUTX2_M2	Divider Control	CM_DIV_M2_DPLL_ABE[4:0] DIVHS
CLKOUTX2_M3	Status	CM_DIV_M3_DPLL_ABE[9] CLKST
CLKOUTX2_M3	Divider Control	CM_DIV_M3_DPLL_ABE [4:0] DIVHS

3.6.3.6.3 Power Modes

This section identifies the operating modes supported by the DPLL and the control bit fields to set its operating modes. For an explanation of the DPLL operating modes and associated control and status features, see Section 3.6.3.3.2, *Enable Control, Status, and Low-Power Operation Mode*, and Section 3.6.3.3.3, *DPLL Power Mode*.

Table 3-64 lists the operating modes supported by the DPLL.

Table 3-64. DPLL_ABE Modes

Low-Power Stop	Fast-Relock Stop	Low-Power Bypass	Fast-Relock Bypass	Lock
Not available	Not available	Available	Available	Available

Table 3-65 lists the control bit fields for the operating mode control of the DPLL.

Table 3-65. DPLL_ABE Mode Control Parameters

Parameter Name	Control Bit Field
Low-Power Mode Control	CM_CLKMODE_DPLL_ABE[10] DPLL_LPMODE_EN
Manual Mode Control	CM_CLKMODE_DPLL_ABE[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_ABE[2:0] AUTO_DPLL_MODE

3.6.3.6.4 Recalibration

Table 3-66 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. For an explanation of the DPLL recalibration feature, see Section 3.6.3.3.4, *DPLL Recalibration*.

Table 3-66. DPLL_ABE Recalibration Feature Parameters

Parameter Name	Control/Status Bit Field
Recalibration – Enable Control	CM_CLKMODE_DPLL_ABE[8] DPLL_DRIFTGUARD_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_MPU[4] DPLL_ABE_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_MPU[4] DPLL_ABE_RECAL_EN

3.6.3.6.5 Spread Spectrum Clocking

Table 3-67 lists the control bit fields associated with the SSC features of the DPLL. For an explanation of the DPLL SSC feature, see Section 3.6.3.3.5, *DPLL Spread Spectrum Clocking*.

Table 3-67. DPLL_ABE Spread-Spectrum Clocking Feature Parameters

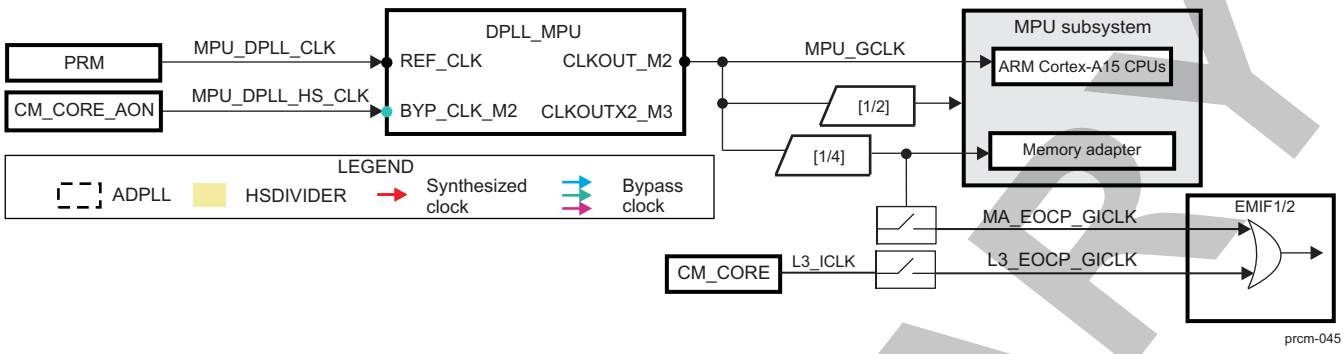
Parameter Name	Control Bit Field
SSC Downspread	CM_CLKMODE_DPLL_ABE[14] DPLL_SSC_DOWNSPREAD
SSC Acknowledge	CM_CLKMODE_DPLL_ABE[13] DPLL_SSC_ACK
SSC Enable Control	CM_CLKMODE_DPLL_ABE[12] DPLL_SSC_EN
Modulation Step Size Setting	CM_SSC_DELTAMSTEP_DPLL_ABE[19:0] DELTAMSTEP
Modulation Frequency Divider – Exponent	CM_SSC_MODFREQDIV_DPLL_ABE[10:8] MODFREQDIV_EXPONENT
Modulation Frequency Divider – Mantissa	CM_SSC_MODFREQDIV_DPLL_ABE[6:0] MODFREQDIV_MANTISSA

3.6.3.7 DPLL_MPU Description

3.6.3.7.1 Overview

Figure 3-52 is an overview of the DPLL. For a functional overview of a generic DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Figure 3-52. DPLL_MPU Overview



3.6.3.7.2 Tactical Clocking Adjustment

Figure 3-52 includes the clocking adjustment scheme for DPLL_MPU. Another clock is requested by the EMIF1/2 modules and this clock must be dynamically switched between L3_EOCP_GICLK clock and MA_EOCP_GICLK clock coming from the MPU subsystem (namely from Memory Adapter part of it), depending on the respective activity of MPU and EMIF clock domain.

3.6.3.7.3 Synthesized Clock Parameters

This section describes the clock synthesis and clock out divider parameters of the DPLL. See Section 3.6.3.3, *Generic DPLL Overview*, for an explanation of the clock synthesis and output divider parameters of the DPLL module.

Table 3-68 lists the clock synthesis parameters of the DPLL.

Table 3-68. DPLL_MPU Clock Synthesis Parameters

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_MPU[18:8] DPLL_MULT
N	CM_CLKSEL_DPLL_MPU[6:0] DPLL_DIV

Table 3-69 lists the clock output divider parameters of the DPLL.

Table 3-69. DPLL_MPU Clock Output Parameters

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUT_M2	Status	CM_DIV_M2_DPLL_MPU[9] CLKST
CLKOUT_M2	Divider control	CM_DIV_M2_DPLL_MPU[4:0] DIVHS
CLKOUT_M2 - DCC	DCC feature control	CM_CLKSEL_DPLL_MPU[22] DCC_EN

3.6.3.7.4 Power Modes

This section identifies the operating modes supported by the DPLL and the control bit fields to set its operating modes. For an explanation of the DPLL operating modes, and associated control and status features, see Section 3.6.3.3.2, *Enable Control, Status, and Low-Power Operation Mode*, and Section 3.6.3.3.3, *DPLL Power Modes*.

Table 3-70 lists the operating modes supported by the DPLL.

Table 3-70. DPLL_MPU Modes

Low-Power Stop	Fast-Relock Stop	Low-Power Bypass	Fast-Relock Bypass	Lock
Not available	Not available	Available	Available	Available

Table 3-71 lists the control bit fields for the operating mode control of the DPLL.

Table 3-71. DPLL_MPU Mode Control Parameters

Parameter Name	Control Bit Field
Low-Power Mode Control	CM_CLKMODE_DPLL_MPU[10] DPLL_LPMODE_EN
Manual Mode Control	CM_CLKMODE_DPLL_MPU[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_MPU[2:0] AUTO_DPLL_MODE

NOTE: The user software must ensure that the MPU voltage domain is on before programming DPLL_MPU. This can be ensured by performing a forced wakeup (CLKCTRL= SW_WKUP) on MPU domain. When software detects that the domain is "ON", DPLL_MPU can be programmed.

3.6.3.7.5 Recalibration

Table 3-72 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. For an explanation of the DPLL recalibration feature, see Section 3.6.3.3.4, *DPLL Recalibration*.

Table 3-72. DPLL_MPU Recalibration Feature Parameters

Parameter Name	Control/Status Bit Field
Recalibration – Enable Control	CM_CLKMODE_DPLL_MPU[8] DPLL_DRIFTGUARD_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_MPU[1] DPLL_MPU_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_MPU[1] DPLL_MPU_RECAL_EN

3.6.3.7.6 Spread Spectrum Clocking

Table 3-73 lists the control bit fields associated with the SSC features of the DPLL. For an explanation of the DPLL SSC feature, see Section 3.6.3.3.5, *DPLL Spread Spectrum Clocking*.

Table 3-73. DPLL_MPU Spread-Spectrum Clocking Feature Parameters

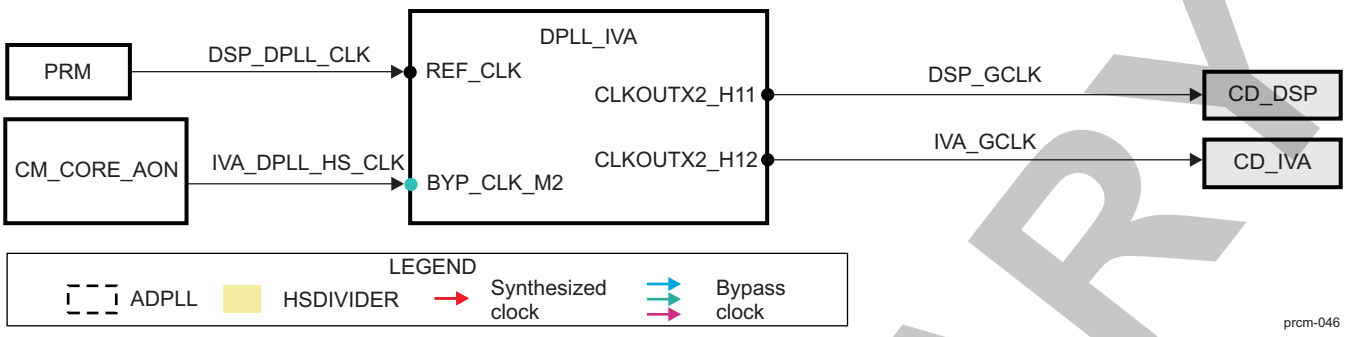
Parameter Name	Control Bit Field
SSC Downspread	CM_CLKMODE_DPLL_MPU[14] DPLL_SSC_DOWNSPREAD
SSC Acknowledge	CM_CLKMODE_DPLL_MPU[13] DPLL_SSC_ACK
SSC Enable Control	CM_CLKMODE_DPLL_MPU[12] DPLL_SSC_EN
Modulation Step Size Setting	CM_SSC_DELTAMSTEP_DPLL_MPU[19:0] DELTAMSTEP
Modulation Frequency Divider – Exponent	CM_SSC_MODFREQDIV_DPLL_MPU[10:8] MODFREQDIV_EXPONENT
Modulation Frequency Divider – Mantissa	CM_SSC_MODFREQDIV_DPLL_MPU[6:0] MODFREQDIV_MANTISSA

3.6.3.8 DPLL_IVA Description

3.6.3.8.1 Overview

Figure 3-53 is an overview of the DPLL. For a functional overview of a generic DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Figure 3-53. DPLL_IVA Overview



3.6.3.8.2 Synthesized Clock Parameters

This section describes the clock synthesis and clock-out divider parameters of the DPLL. For an explanation of the clock synthesis and output divider parameters of the DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Table 3-74 lists the clock synthesis parameters of the DPLL.

Table 3-74. DPLL_IVA Clock Synthesis Parameters

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_IVA[18:8] DPLL_MULT
N	CM_CLKSEL_DPLL_IVA[6:0] DPLL_DIV

Table 3-75 lists the clock output divider parameters of the DPLL.

Table 3-75. DPLL_IVA Clock Output Parameters

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUTX2_H11	Status	CM_DIV_H11_DPLL_IVA[9] CLKST
CLKOUTX2_H11	Divider control	CM_DIV_H11_DPLL_IVA[5:0] DIVHS
CLKOUTX2_H12	Status	CM_DIV_H12_DPLL_IVA[9] CLKST
CLKOUTX2_H12	Divider control	CM_DIV_H12_DPLL_IVA[5:0] DIVHS

NOTE: Softaware must be ensure that MM Voltage domain is ON before programming DPLL_IVA. This can be guarantied by performing force wakeup (CLKCTRL = SW_WKUP) on one of the domain of the MM voltage domain. When software detects domain is "ON", DPLL_IVA can be programmed.

3.6.3.8.3 Power Modes

This section identifies the operating modes supported by the DPLL and the control bit fields to set its operating modes. For an explanation of the DPLL operating modes and associated control and status features, see Section 3.6.3.3.2, *Enable Control, Status, and Low-Power Operation Mode*, and Section 3.6.3.3.3, *DPLL Power Modes*.

Table 3-76 lists the operating modes supported by the DPLL.

Table 3-76. DPLL_IVA Modes

Low-Power Stop	Fast-Relock Stop	Low-Power Bypass	Fast-Relock Bypass	Lock
Not available	Not available	Available	Available	Available

Table 3-77 lists the control bit fields for the operating mode control of the DPLL.

Table 3-77. DPLL_IVA Mode Control Parameters

Parameter Name	Control Bit Field
Low-Power Mode Control	CM_CLKMODE_DPLL_IVA[10] DPLL_LPMODE_EN
Manual Mode Control	CM_CLKMODE_DPLL_IVA[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_IVA[2:0] AUTO_DPLL_MODE

NOTE: The user software must ensure that the MM voltage domain is on before programming DPLL_IVA. This can be ensured by performing a forced wakeup (CLKCTRL= SW_WKUP) on one of the domains of the MM voltage domain. When software detects that the domain is on, DPLL_IVA can be programmed.

3.6.3.8.4 Recalibration

Table 3-78 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. For an explanation of the DPLL recalibration feature, see Section 3.6.3.3.4, *DPLL Recalibration*.

Table 3-78. DPLL_IVA Recalibration Feature Parameters

Parameter Name	Control/Status Bit Field
Recalibration – Enable Control	CM_CLKMODE_DPLL_IVA[8] DPLL_DRIFTGUARD_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_MPU[2] DPLL_IVA_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_MPU[2] DPLL_IVA_RECAL_EN
Recalibration – Interrupt Status	PRM_IRQSTATUS_IPU[2] DPLL_IVA_RECAL_ST
Recalibration – Interrupt Mask Control	PRM_IRQENABLE_IPU[2] DPLL_IVA_RECAL_EN

3.6.3.8.5 Spread Spectrum Clocking

Table 3-79 lists the control bit fields associated with the SSC features of the DPLL. For an explanation of the DPLL SSC feature, see Section 3.6.3.3.5, *DPLL Spread Spectrum Clocking*.

Table 3-79. DPLL_IVA Spread-Spectrum Clocking Feature Parameters

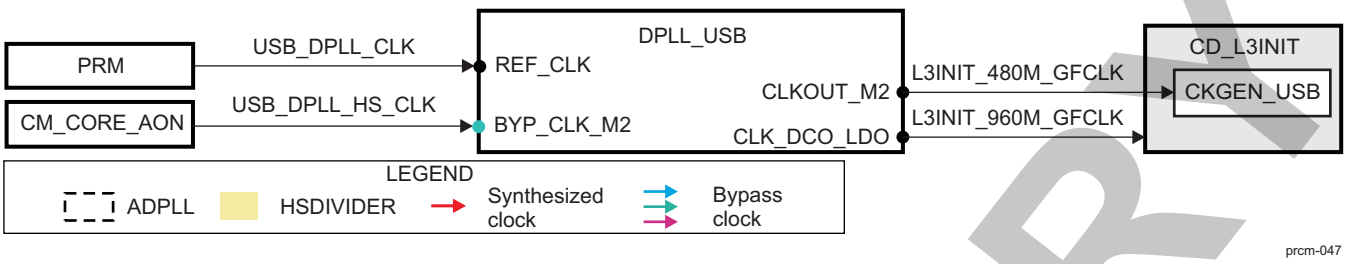
Parameter Name	Control Bit Field
SSC Downspread	CM_CLKMODE_DPLL_IVA[14] DPLL_SSC_DOWNSPREAD
SSC Acknowledge	CM_CLKMODE_DPLL_IVA[13] DPLL_SSC_ACK
SSC Enable Control	CM_CLKMODE_DPLL_IVA[12] DPLL_SSC_EN
Modulation Step Size Setting	CM_SSC_DELTAMSTEP_DPLL_IVA[19:0] DELTAMSTEP
Modulation Frequency Divider – Exponent	CM_SSC_MODFREQDIV_DPLL_IVA[10:8] MODFREQDIV_EXPONENT
Modulation Frequency Divider – Mantissa	CM_SSC_MODFREQDIV_DPLL_IVA[6:0] MODFREQDIV_MANTISSA

3.6.3.9 DPLL_USB Description

3.6.3.9.1 Overview

Figure 3-54 is an overview of the DPLL. For a functional overview of a generic DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Figure 3-54. DPLL_USB Overview



3.6.3.9.2 Synthesized Clock Parameters

This section describes the clock synthesis and clock out divider parameters of the DPLL. For an explanation of the clock synthesis and output divider parameters of the DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

Table 3-80 lists the clock synthesis parameters of the DPLL.

Table 3-80. DPLL_USB Clock Synthesis Parameters

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_USB[19:8] DPLL_MULT
N	CM_CLKSEL_DPLL_USB[7:0] DPLL_DIV

Table 3-81 lists the clock output divider parameters of the DPLL.

Table 3-81. DPLL_USB Clock Output Parameters

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUT_M2	Status	CM_DIV_M2_DPLL_USB[9] CLKST
CLKOUT_M2	Divider control	CM_DIV_M2_DPLL_USB[6:0] DIVHS
CLK_DCO_LDO	DCO output control	CM_CLKSEL_DPLL_USB[21] DPLL_SELFREQDCO

3.6.3.9.3 Power Modes

This section identifies the operating modes supported by the DPLL and the control bit fields to set its operating modes. For an explanation of the DPLL operating modes and associated control and status features, see Section 3.6.3.3.2, *Enable Control, Status, and Low-Power Operation Mode,* and Section 3.6.3.3.3, *DPLL Power Modes*.

Table 3-82 lists the operating modes supported by the DPLL.

Table 3-82. DPLL_USB Modes

Low-Power Stop	Low-Power Bypass	Lock
Available	Available	Available

NOTE: It is prohibited to program DPLL_USB automatic idle mode with a PD_L3_INIT low power state equal to OFF. Moreover, DPLL_USB programming can be done only when PD_L3_INIT power domain is ON

Table 3-83 lists the control bit fields for the operating mode control of the DPLL.

Table 3-83. DPLL_USB Mode Control Parameters

Parameter Name	Control Bit Field
Manual Mode Control	CM_CLKMODE_DPLL_USB[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_USB[2:0] AUTO_DPLL_MODE

3.6.3.9.4 Spread Spectrum Clocking

Table 3-84 lists the control bit fields associated with the SSC features of the DPLL. For an explanation of the DPLL SSC feature, see Section 3.6.3.3.5, *DPLL Spread Spectrum Clocking*.

Table 3-84. DPLL_USB Spread-Spectrum Clocking Feature Parameters

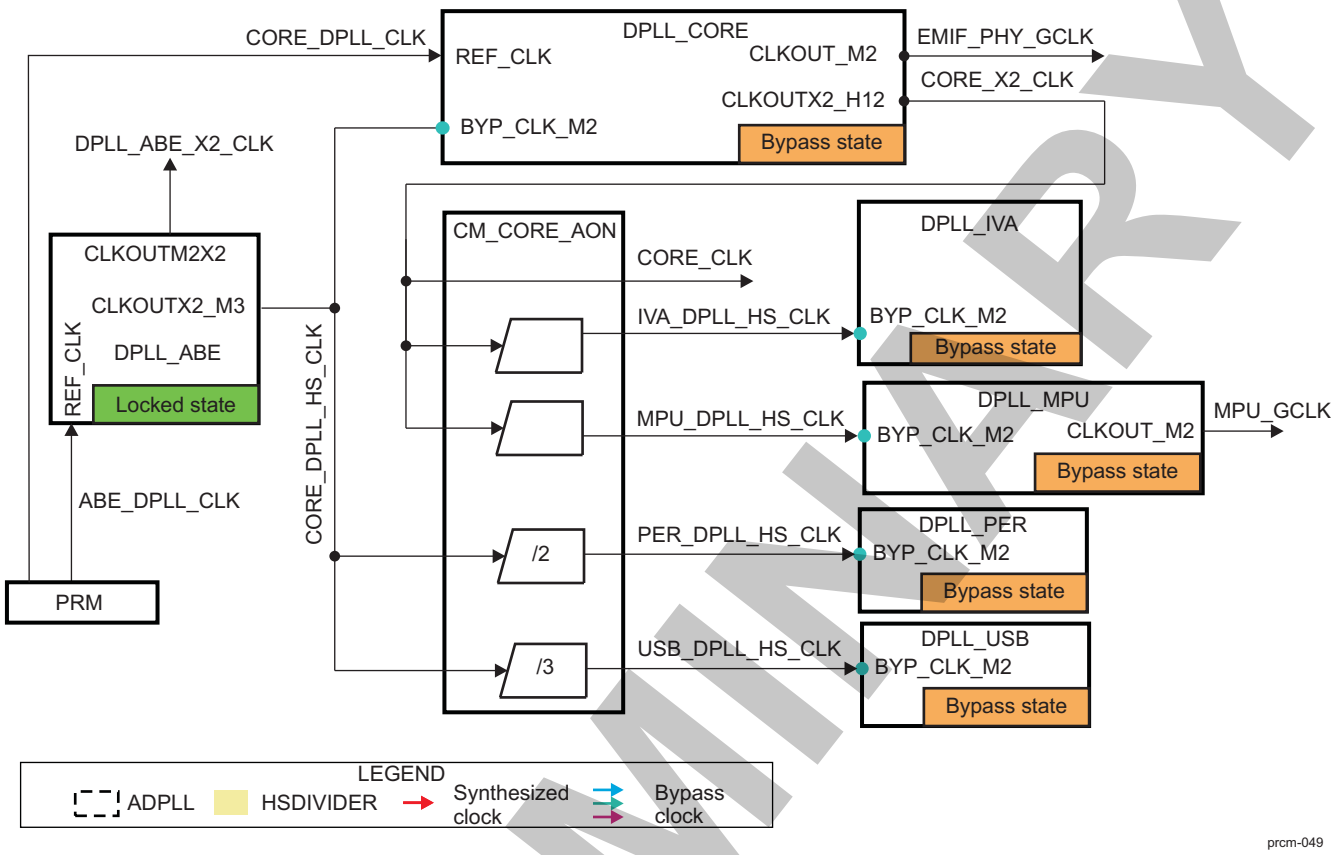
Parameter Name	Control Bit Field
SSC Downspread	CM_CLKMODE_DPLL_USB[14] DPLL_SSC_DOWNSPREAD
SSC Acknowledge	CM_CLKMODE_DPLL_USB[13] DPLL_SSC_ACK
SSC Enable Control	CM_CLKMODE_DPLL_USB[12] DPLL_SSC_EN
Modulation Step Size Setting	CM_SSC_DELTAMSTEP_DPLL_USB[20:0] DELTAMSTEP
Modulation Frequency Divider – Exponent	CM_SSC_MODFREQDIV_DPLL_USB[10:8] MODFREQDIV_EXPONENT
Modulation Frequency Divider – Mantissa	CM_SSC_MODFREQDIV_DPLL_USB[6:0] MODFREQDIV_MANTISSA

3.6.3.10 DPLLs Cascading

To reduce the device power consumption in certain low-power use cases of the device, the DPLLs in the device can be cascaded so that the functional clock to a power domain is provided by a DPLL upstream without locking the DPLL associated with the domain. In such a case, the unlocked DPLLs can be kept in low-power bypass mode.

Figure 3-55 shows a generic scheme for cascading DPLLs.

Figure 3-55. DPLLs Cascading Overview



The sequence to enable DPLL cascading is:

1. DPLL_ABE is locked by software request. Other DPLLs downstream must not be moved to bypass mode before DPLL_ABE is locked. This ensures that the output clocks of these DPLLs are not stopped when they switch to the DPLL_ABE output clock. The ABE clock domain must be configured into SW_WKUP during DPLL cascading mode.
2. Internal EMIF shadow registers are set to take the PHY clock and DLL reference clock derived from DPLL_ABE.
3. Bypass path for DPLL_IVA is set up by configuring the programmable dividers in CM_CORE_AON that provide the bypass clock. The setting is based on the OPP requirements.
4. DPLL_IVA and DPLL_MPU are put into bypass mode by software (any of the bypass mode is allowed), and the output of the DPLLs, if already enabled, switches from locked clock to bypass clock from DPLL_CORE.
5. DPLL_PER and DPLL_USB are also put into bypass mode by software, if required. The outputs of the DPLLs, if enabled, switch to the divided clock of DPLL_ABE CLKOUTX2_M3.
6. Ensure that the CORE_CLK divider in CM_CORE_AON is programmed correctly to handle the OPP needs of the CORE power domain before this step.

   DPLL_CORE is set in bypass mode by configuring the input mux of the bypass clocks and the CM_SHADOW_FREQ_CONFIG1[10:8] DPLL_CORE_DPLL_EN bit field to bypass mode in the DVFS shadow register in CM_CORE_AON, and setting the CM_SHADOW_FREQ_CONFIG1[0] FREQ_UPDATE bit to 1 by software. This step triggers the handshake with EMIF to safely unlock the DPLL and move the output clock of DPLL_CORE to CORE_DPLL_HS_CLK.
7. Software can then switch the L4_WKUP interface clock from SYS_CLK to ABE_LP_CLK to allow for deasserting the SYS_CLK request line to SCRM, if SYS_CLK is not requested by any other dependency.

The sequence to disable the DPLL cascading is:

1. Software switches the L4_WKUP interface clock from ABE_LP_CLK to SYS_CLK requesting the restart of SYS_CLK by the SCRM, if not already present.
2. Software programs the EMIF internal shadow registers to prepare the switchback of EMIF from using the DPLL_ABE clock to the DPLL_CORE clock.
3. DPLL_IVA/DPLL_MPU bypass path is correctly set for the targeted DPLL_CORE frequency by programming the bypass dividers for the DPLL in CM_CORE_AON.
4. DPLL_CORE is relocked using the DVFS shadow register in CM_CORE_AON. The PRCM module ensures that this step is executed with proper handshake with EMIF to allow for a frequency update on the EMIF.
5. Other DPLLs are also locked, if required, to exit completely from DPLL cascading mode.
6. DPLL_ABE may be forced into STOPMODE or bypass mode by software or may enter one of the auto modes if so programmed.

NOTE: The DPLLs cascading is useful in MP3 playback use case, while using the SYS_32K clock only, and SYS_CLK is gated.

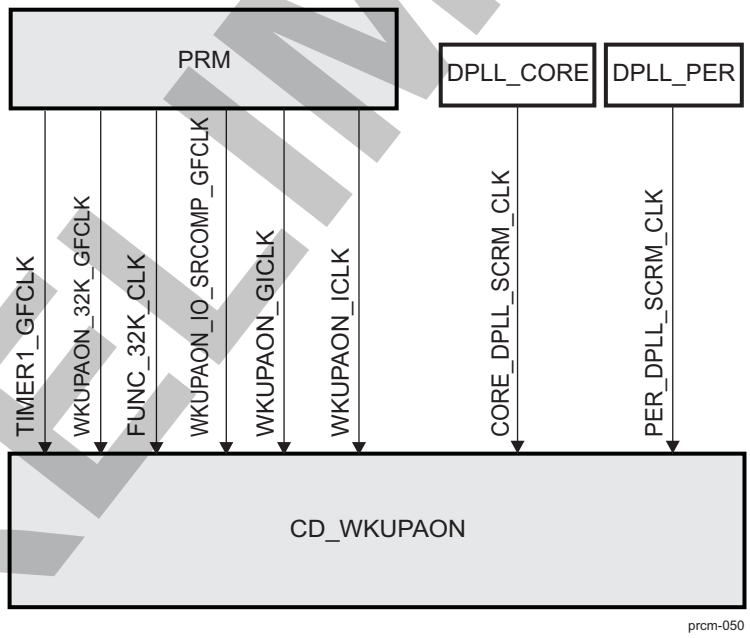
3.6.4 CD_WKUPAON Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.4.1 Overview

Figure 3-56 is an overview of the clock domain.

Figure 3-56. CD_WKUPAON Overview



3.6.4.2 Specific properties and signals.

PRCM provides WKUPAON_IO_SRCOMP_PWRDN signal to the smart IO compensation cell part of WKUP voltage domain. This signal is fully controlled by HW. After power on reset, SW has to enable IO slew rate compensation cell clock by setting CM_WKUPAON_IO_SRCOMP_CLKCTRL[8] CLKEN_SRCOMP_FCLK. PRCM enables WKUPAON_IO_SRCOMP_GFCLK clock and de-assert WKUPAON_IO_SRCOMP_PWRDN signal.

Before device transition to low power state, PRCM:

1. Asserts WKUPAON_IO_SRCOMP_PWRDN signal first.
2. Wait for 8 SYS_CLK cycles.
3. Gates WKUPAON_IO_SRCOMP_GFCLK clock.

When device wakes-up from low power state, PRCM enables automatically WKUPAON_IO_SRCOMP_GFCLK clock and de-asserts WKUPAON_IO_SRCOMP_PWRDN signal.

NOTE:

1. By clearing CM_WKUPAON_IO_SRCOMP_CLKCTRL[8] CLKEN_SRCOMP_FCLK bitfield can disable WKUPAON_IO_SRCOMP_GFCLK clock and set WKUPAON_IO_SRCOMP_PWRDN signal.
2. For low power cases, to allow gating of SYS_CLK, it has to disable WKUPAON_IO_SRCOMP_GFCLK clock.

3.6.4.3 Clock Domain Modes

Table 3-85 lists the clock domain modes supported by the clock domain.

Table 3-85. CD_WKUPAON Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Not available	Available

Table 3-86 lists the clock domain state transition control and status bits for the clock in this clock domain

Table 3-86. CD_WKUPAON Control and Status Parameters

Parameter Name	Control/Status Bit Field
ABE_LP_CLK Clock Status	CM_WKUPAON_CLKSTCTRL[9] CLKACTIVITY_ABE_LP_CLK
WKUPAON_GICLK Clock Status	CM_WKUPAON_CLKSTCTRL[12] CLKACTIVITY_WKUPAON_GICLK
SYS_CLK Clock Status; includes profiling EMU_SYS_CLK and all functional SYS_CLK	CM_WKUPAON_CLKSTCTRL[8] CLKACTIVITY_SYS_CLK
SYS_CLK Status when running at SCRM level	CM_WKUPAON_CLKSTCTRL[15] CLKACTIVITY_SYS_CLK_ALL
SYS_CLK Clock Status of functional branches, exclude activity of the EMU_SYS_GCLK clock	CM_WKUPAON_CLKSTCTRL[14] CLKACTIVITY_SYS_CLK_FUNC
WKUPAON_32K_GFCLK Clock Status	CM_WKUPAON_CLKSTCTRL[11] CLKACTIVITY_WKUPAON_32K_GFCLK
WKUPAON_32K_GFCLK Clock Control for GPIO1	CM_WKUPAON_GPIO1_CLKCTRL[8] OPTFCLKEN_DBCLK
WKUPAON_IO_SRCOMP_GFCLK Clock Status	CM_WKUPAON_CLKSTCTRL[13] CLKACTIVITY_WKUPAON_IO_SRCOMP_GFCLK
PER_DPLL_SCRM_CLK Clock Control	CM_WKUPAON_SCRM_CLKCTRL[9] OPTFCLKEN_SCRM_PER
CORE_DPLL_SCRM_CLK Clock Control	CM_WKUPAON_SCRM_CLKCTRL[8] OPTFCLKEN_SCRM_CORE
WKUPAON_IO_SRCOMP_GFCLK Clock Control	CM_WKUPAON_IO_SRCOMP_CLKCTRL[8] CLKEN_SRCOMP_FCLK
Clock Domain State Transition Control	CM_WKUPAON_CLKSTCTRL[1:0] CLKTRCTRL

3.6.4.4 Clock Domain Dependency

CD_WKUPAON has no static dependency or dynamic dependency with any other clock domain of the device.

3.6.4.4.1 Wake-Up Dependency

Table 3-87 lists the wake-up dependency settings for the modules of this clock domain.

Table 3-87. CD_WKUPAON Wake-Up Dependency Association Parameters

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
GPIO1	CD_WKUPAON	CD_DSP	Enabled	PM_WKUPAON_GPIO1_WKDEP[6] WKUPDEP_GPIO1_IRQ2_DSP	Read/write
GPIO1	CD_WKUPAON	CD_IPU	Disabled	PM_WKUPAON_GPIO1_WKDEP[1] WKUPDEP_GPIO1_IRQ1_IPU	Read/write
GPIO1	CD_WKUPAON	CD_MPU	Disabled	PM_WKUPAON_GPIO1_WKDEP[0] WKUPDEP_GPIO1_IRQ1_MPU	Read/write
KBD	CD_WKUPAON	CD_MPU	Enabled	PM_WKUPAON_KBD_WKDEP[0] WKUPDEP_KBD_MPU	Read/write
TIMER1	CD_WKUPAON	CD_MPU	Enabled	PM_WKUPAON_TIMER1_WKDEP[0] WKUPDEP_TIMER1_MPU	Read/write
WD_TIMER2	CD_WKUPAON	CD_MPU	Disabled	PM_WKUPAON_WD_TIMER2_WKDEP[0] WKUPDEP_WD_TIMER2_MPU	Read/write

3.6.4.5 Clock Domain Module Attributes

Table 3-88 lists for each module of the clock domain the clocks it receives and their role (that is, functional or interface clock).

Table 3-88. CD_WKUPAON Modules Clocks Association

Module	Clock	Clock Type
PRCM_MPU	SYS_32K	Functional
	WKUPAON_ICLK	Interface
GPIO1	WKUPAON_GICLK	Interface
	WKUPAON_32K_GFCLK	Functional
KBD	WKUPAON_GICLK	Interface
	WKUPAON_32K_GFCLK	Functional
SAR_RAM	WKUPAON_GICLK	Interface
COUNTER_32K	SYS_32K	Functional
	WKUPAON_GICLK	Interface
TIMER1	TIMER1_FCLK	Functional
	WKUPAON_GICLK	Interface
WD_TIMER2	WKUPAON_GICLK	Interface
	WKUPAON_32K_GFCLK	Functional
CTRL_MODULE_WKUP	WKUPAON_GICLK	Interface
SCRM	WKUPAON_GICLK	Interface
	PER_DPLL_SCRM_CLK	Functional
	CORE_DPLL_SCRM_CLK	Functional
L4_WKUP interconnect	WKUPAON_GICLK	Interface
IO_SRCOMP_WKUP	WKUPAON_IO_SRCOMP_GFCLK	Functional

Table 3-89 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-89. CD_WKUPAON Modules Wake-Up Request

Module	Wake-Up Feature
PRCM_MPU	None
CTRL_MODULE_WKUP	None
IO_SRCOMP_WKUP	None
SCRM	None
GPIO1	Slave wake-up request (MPU-IRQ, IPU-IRQ, DSP-IRQ)
KBD	Slave wake-up request (MPU-IRQ)
SAR_RAM	None
COUNTER_32K	None
TIMER1	Slave wake-up request (MPU-IRQ)
WD_TIMER2	Slave wake-up request (MPU-IRQ)
L4_WKUP interconnect	None

Table 3-90 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-90. CD_WKUPAON Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
GPIO1	Slave	CM_WKUPAON_GPIO1_CLKCTRL[17:16] IDLEST	Idle status
KBD	Slave	CM_WKUPAON_KBD_CLKCTRL[17:16] IDLEST	Idle status
SAR_RAM	Slave	CM_WKUPAON_SAR_RAM_CLKCTRL[17:16] IDLEST	Idle status
COUNTER_32K	Slave	CM_WKUPAON_COUNTER_32K_CLKCTRL[17:16] IDLEST	Idle status
TIMER1	Slave	CM_WKUPAON_TIMER1_CLKCTRL[17:16] IDLEST	Idle status
WD_TIMER2	Slave	CM_WKUPAON_WD_TIMER2_CLKCTRL[17:16] IDLEST	Idle status
L4_WKUP interconnect	Slave	CM_WKUPAON_L4_WKUP_CLKCTRL[17:16] IDLEST	Idle status

Table 3-91 lists the supported clock management modes and associated software control bit fields for each module of the power domain.

Table 3-91. CD_WKUPAON Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
GPIO1	Available	Available	N/A	CM_WKUPAON_GPIO1_CLKCTRL[1:0] MODULEMODE	Read/write
KBD	Available	N/A	Available	CM_WKUPAON_KBD_CLKCTRL[1:0] MODULEMODE	Read/write
SAR_RAM	N/A	Available	N/A	CM_WKUPAON_SAR_RAM_CLKCTRL[1:0] MODULEMODE	Read only
COUNTER_32K	N/A	Available	N/A	CM_WKUPAON_COUNTER_32K_CLKCTRL[1:0] MODULEMODE	Read only
TIMER1	Available	N/A	Available	CM_WKUPAON_TIMER1_CLKCTRL[1:0] MODULEMODE	Read/write

Table 3-91. CD_WKUPAON Modules Slave Clock-Management Modes and Control (continued)

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
WD_TIMER2	Available	N/A	Available	CM_WKUPAON_WD_TIMER2_CLKCTRL[1:0] MODULEMODE	Read/write
L4_WKUP interconnect	N/A	Available	N/A	CM_WKUPAON_L4_WKUP_CLKCTRL[1:0] MODULEMODE	Read only

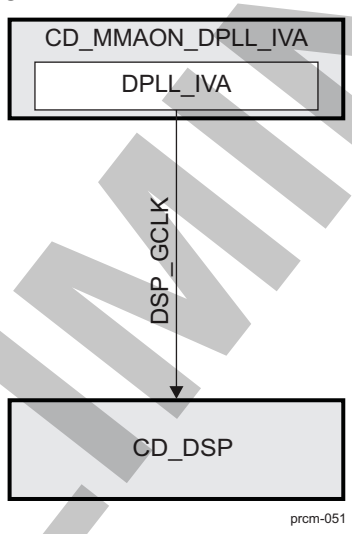
3.6.5 CD_DSP Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.5.1 Overview

Figure 3-57 is an overview of the clock domain.

Figure 3-57. CD_DSP Overview



3.6.5.2 Clock Domain Modes

Table 3-92 lists the modes supported by the clock domain.

Table 3-92. CD_DSP Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-93 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-93. CD_DSP Control and Status Parameters

Parameter Name	Control/Status Bit Field
DSP_GCLK Clock Status	CM_DSP_CLKSTCTRL[8] CLKACTIVITY_DSP_GCLK
Clock Domain State Transition Control	CM_DSP_CLKSTCTRL[1:0] CLKTRCTRL

3.6.5.3 Clock Domain Dependency

CD_DSP has no module wake-up dependency with any other clock domain of the device.

3.6.5.3.1 Static Dependency

Table 3-94 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-94. CD_DSP Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Disabled	CM_DSP_STATICDEP[3] ABE_STATDEP	Read/write
CD_CAM	Always disabled	CM_DSP_STATICDEP[9] CAM_STATDEP	Read only
CD_IVA	Disabled	CM_DSP_STATICDEP[2] IVA_STATDEP	Read/write
CD_L3_MAIN1	Disabled	CM_DSP_STATICDEP[5] L3MAIN1_STATDEP	Read/write
CD_L3_MAIN2	Disabled	CM_DSP_STATICDEP[6] L3MAIN2_STATDEP	Read/write
CD_L3INIT	Disabled	CM_DSP_STATICDEP[7] L3INIT_STATDEP	Read/write
CD_L4_CFG	Disabled	CM_DSP_STATICDEP[12] L4CFG_STATDEP	Read/write
CD_L4_PER	Disabled	CM_DSP_STATICDEP[13] L4PER_STATDEP	Read/write
CD_EMIF	Disabled	CM_DSP_STATICDEP[4] EMIF_STATDEP	Read/write
CD_WKUPAON	Disabled	CM_DSP_STATICDEP[15] WKUPAON_STATDEP	Read/write
CD_COREAON	Always disabled	CM_DSP_STATICDEP[16] COREAON_STATDEP	Read only
CD_CUSTEFUSE	Always disabled	CM_DSP_STATICDEP[17] CUSTEFUSE_STATDEP	Read only

3.6.5.3.2 Dynamic Dependency

Table 3-95 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-95. CD_DSP Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Always enabled	CM_DSP_DYNAMICDEP[3] ABE_DYNDEP	Read only
CD_IVA	Always enabled	CM_DSP_DYNAMICDEP[2] IVA_DYNDEP	Read only
CD_L3_MAIN1	Always enabled	CM_DSP_DYNAMICDEP[5] L3MAIN1_DYNDEP	Read only

3.6.5.4 Clock Domain Module Attributes

Table 3-96 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-96. CD_DSP Modules Clocks Association

Module	Clock	Clock Type
DSP	DSP_GCLK	Interface and functional

Table 3-97 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-97. CD_DSP Modules Wake-Up Request

Module	Wake-Up Feature
DSP	Master wake-up request

Table 3-98 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-98. CD_DSP Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
DSP	Master/slave	CM_DSP_DSP_CLKCTRL[18] STBYST	Standby status
		CM_DSP_DSP_CLKCTRL[17:16] IDLEST	Idle status

Table 3-99 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-99. CD_DSP Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
DSP	Available	Available	N/A	CM_DSP_DSP_CLKCTRL[1:0] MODULEMODE	Read/write

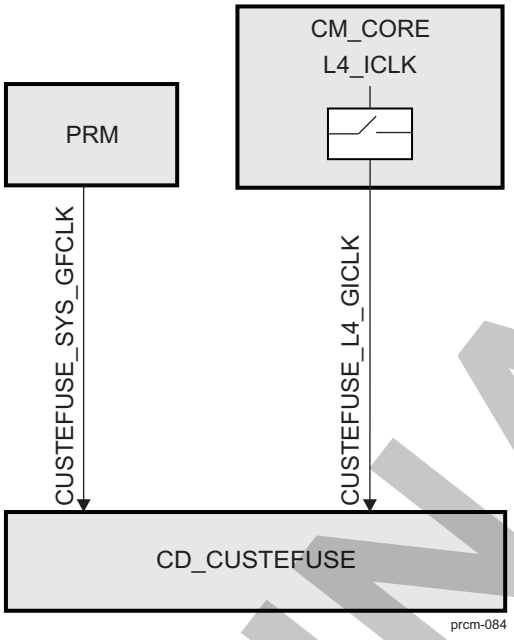
3.6.6 CD_CUSTEFUSE Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.6.1 Overview

Figure 3-57 is an overview of the clock domain.

Figure 3-58. CD_CUSTEFUSE Overview



3.6.6.2 Clock Domain Modes

Table 3-92 lists the modes supported by the clock domain.

Table 3-100. CD_CUSTEFUSE Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	N/A	Available	Available

Table 3-93 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-101. CD_CUSTEFUSE Control and Status Parameters

Parameter Name	Control/Status Bit Field
CUSTEFUSE_SYS_GFCLK Clock Status	CM_CUSTEFUSE_CLKSTCTRL[9] CLKACTIVITY_CUSTEFUSE_SYS_GFCLK
CUSTEFUSE_L4_GICLK Clock Status	CM_CUSTEFUSE_CLKSTCTRL[8] CLKACTIVITY_CUSTEFUSE_L4_GICLK
Clock Domain State Transition Control	CM_CUSTEFUSE_CLKSTCTRL[1:0] CLKTRCTRL

3.6.6.3 Clock Domain Dependency

CD_CUSTEFUSE has no static or dynamic dependency with any other clock domain of the device.

3.6.6.4 Clock Domain Module Attributes

Table 3-96 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-102. CD_CUSTEFUSE Modules Clocks Association

Module	Clock	Clock Type
EFUSE_CTRL_CUST	CUSTEFUSE_SYS_GFCLK	Functional
	CUSTEFUSE_L4_GICLK	Interface

Table 3-97 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-103. CD_CUSTEFUSE Modules Wake-Up Request

Module	Wake-Up Feature
EFUSE_CTRL_CUST	None

Table 3-98 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-104. CD_CUSTEFUSE Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
EFUSE_CTRL_CUST	Idle	CM_CUSTEFUSE_EFUSE_CTRL_CUST_CLKCTRL[17:16] IDLEST	Idle status

Table 3-99 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-105. CD_CUSTEFUSE Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
EFUSE_CTRL_CUST	Available	N/A	Available	CM_CUSTEFUSE_EFUSE_CTRL_CUST_CLKCTRL[1:0] MODULEMODE	Read/write

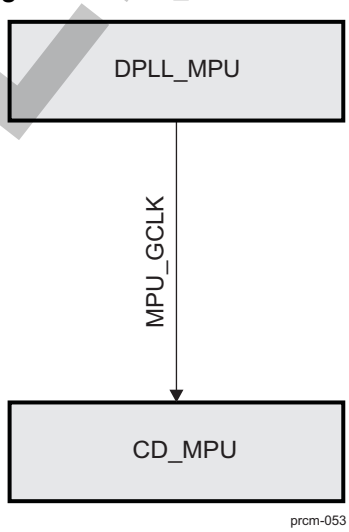
3.6.7 CD_MPU Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.7.1 Overview

Figure 3-59 is an overview of the clock domain.

Figure 3-59. CD_MPU Overview



3.6.7.2 Clock Domain Modes

Table 3-106 lists the clock domain modes supported by the clock domain.

Table 3-106. CD_MPU Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Available	Available

Table 3-107 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-107. CD_MPU Control and Status Parameters

Parameter Name	Control/Status Bit Field
MPU_GCLK Clock Status	CM_MPU_CLKSTCTRL[8] CLKACTIVITY_MPU_GCLK
Clock Domain State Transition Control	CM_MPU_CLKSTCTRL[1:0] CLKTRCTRL

3.6.7.3 Clock Domain Dependency

CD_MPU has no module wake-up dependency with any other clock domain of the device.

3.6.7.3.1 Static Dependency

Table 3-108 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-108. CD_MPU Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Disabled	CM_MPU_STATICDEP[3] ABE_STATDEP	Read/write
CD_CUSTEFUSE	Always disabled	CM_MPU_STATICDEP[17] CUSTEFUSE_STATDEP	Read only
CD_DSS	Disabled	CM_MPU_STATICDEP[8] DSS_STATDEP	Read/write
CD_IPU	Disabled	CM_MPU_STATICDEP[0] IPU_STATDEP	Read/write
CD_GPU	Disabled	CM_MPU_STATICDEP[10] GPU_STATDEP	Read/write
CD_CAM	Always disabled	CM_MPU_STATICDEP[9] CAM_STATDEP	Read only
CD_IVA	Disabled	CM_MPU_STATICDEP[2] IVA_STATDEP	Read/write
CD_L3_MAIN1	Enabled	CM_MPU_STATICDEP[5] L3MAIN1_STATDEP	Read/write
CD_L3_MAIN2	Enabled	CM_MPU_STATICDEP[6] L3MAIN2_STATDEP	Read/write
CD_L3INIT	Enabled	CM_MPU_STATICDEP[7] L3INIT_STATDEP	Read/write
CD_L4_CFG	Enabled	CM_MPU_STATICDEP[12] L4CFG_STATDEP	Read/write
CD_L4_PER	Enabled	CM_MPU_STATICDEP[13] L4PER_STATDEP	Read/write
CD_L4_SEC	Disabled	CM_MPU_STATICDEP[14] L4SEC_STATDEP	Read/write
CD_EMIF	Enabled	CM_MPU_STATICDEP[4] EMIF_STATDEP	Read/write
CD_DMA	Always disabled	CM_MPU_STATICDEP[11] SDMA_STATDEP	Read only
CD_DSP	Disabled	CM_MPU_STATICDEP[1] DSP_STATDEP	Read/write
CD_WKUPAON	Enabled	CM_MPU_STATICDEP[15] WKUPAON_STATDEP	Read/write

Table 3-108. CD_MPU Static Dependency Association Parameters (continued)

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_COREAON	Always disabled	CM_MPU_STATICDEP[16] COREAON_STATDEP	Read only

3.6.7.3.2 Dynamic Dependency

Table 3-109 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-109. CD_MPU Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Always enabled	CM_MPU_DYNAMICDEP[3] ABE_DYNDEP	Read only
CD_L3_MAIN1	Always enabled	CM_MPU_DYNAMICDEP[5] L3_1_DYNDEP	Read only
CD_EMIF	Always enabled	CM_MPU_DYNAMICDEP[4] EMIF_DYNDEP	Read only

3.6.7.4 Clock Domain Module Attributes

Table 3-110 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-110. CD_MPU Modules Clocks Association

Module	Clock	Clock Type
MPU	MPU_GCLK	Interface and functional

Table 3-111 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-111. CD_MPU Modules Wake-Up Request

Module	Wake-Up Feature
MPU	Master wake-up request

Table 3-112 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-112. CD_MPU Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
MPU	Master/slave	CM_MPU_MPU_CLKCTRL[18] STBYST	Standby status
		CM_MPU_MPU_CLKCTRL[17:16] IDLEST	Idle status

Table 3-113 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-113. CD_MPU Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
MPU	N/A	Available	N/A	CM_MPU_MPU_CLKCTRL[1:0] MODULEMODE	Read only

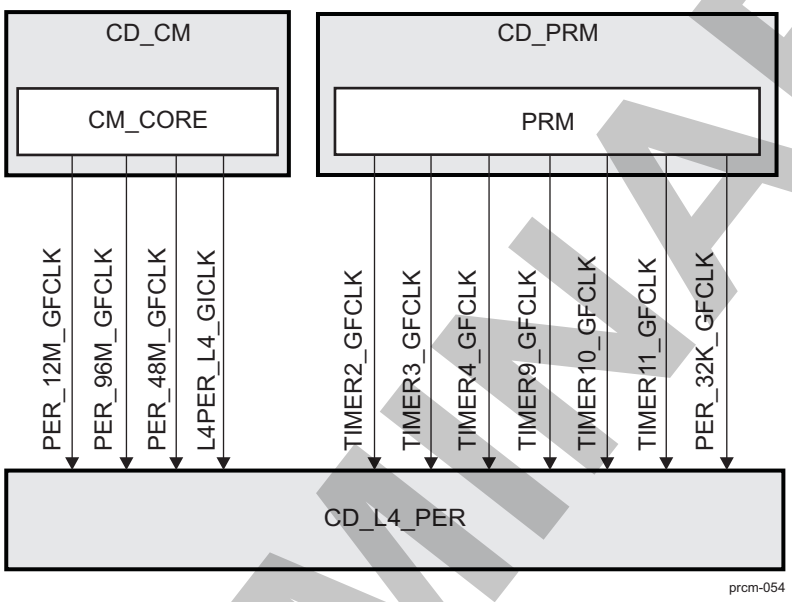
3.6.8 CD_L4_PER Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.8.1 Overview

Figure 3-60 is an overview of the clock domain.

Figure 3-60. CD_L4_PER Overview



3.6.8.2 Clock Domain Modes

Table 3-114 lists the clock domain modes supported by the clock domain.

Table 3-114. CD_L4_PER Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-115 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-115. CD_L4_PER Control and Status Parameters

Parameter Name	Control/Status Bit Field
TIMER10_GFCLK clock status	CM_L4PER_CLKSTCTRL[9] CLKACTIVITY_TIMER10_GFCLK
TIMER11_GFCLK clock status	CM_L4PER_CLKSTCTRL[10] CLKACTIVITY_TIMER11_GFCLK
TIMER2_GFCLK clock status	CM_L4PER_CLKSTCTRL[11] CLKACTIVITY_TIMER2_GFCLK
TIMER3_GFCLK clock status	CM_L4PER_CLKSTCTRL[12] CLKACTIVITY_TIMER3_GFCLK
TIMER4_GFCLK clock status	CM_L4PER_CLKSTCTRL[13] CLKACTIVITY_TIMER4_GFCLK
TIMER9_GFCLK clock status	CM_L4PER_CLKSTCTRL[14] CLKACTIVITY_TIMER9_GFCLK
L4PER_L4_GICLK clock status	CM_L4PER_CLKSTCTRL[8] CLKACTIVITY_L4PER_L4_GICLK
PER_12M_GFCLK clock status	CM_L4PER_CLKSTCTRL[15] CLKACTIVITY_PER_12M_GFCLK
PER_32K_GFCLK clock status	CM_L4PER_CLKSTCTRL[17] CLKACTIVITY_PER_32K_GFCLK
PER_48M_GFCLK clock status	CM_L4PER_CLKSTCTRL[18] CLKACTIVITY_PER_48M_GFCLK

Table 3-115. CD_L4_PER Control and Status Parameters (continued)

Parameter Name	Control/Status Bit Field
PER_96M_GFCLK clock status	CM_L4PER_CLKSTCTRL[19] CLKACTIVITY_PER_96M_GFCLK
Clock Domain State Transition Control	CM_L4PER_CLKSTCTRL[1:0] CLKTRCTRL

3.6.8.3 Clock Domain Dependency

CD_L4_PER has no static dependency with any other clock domain of the device.

3.6.8.3.1 Dynamic Dependency

Table 3-116 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-116. CD_L4_PER Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L4_SEC	Always enabled	CM_L4PER_DYNAMICDEP[14] L4SEC_DYNDEP	Read only
CD_DSS	Always enabled	CM_L4PER_DYNAMICDEP[8] DSS_DYNDEP	Read only
CD_L3INIT	Always enabled	CM_L4PER_DYNAMICDEP[7] L3INIT_DYNDEP	Read only

3.6.8.3.2 Wake-Up Dependency

Table 3-117 lists the wake-up dependency settings for the modules of this clock domain.

Table 3-117. CD_L4_PER Wake-Up Dependency Association Parameters

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
TIMER10	CD_L4_PER	CD_MPU, CD_L3_MAIN1, CD_L3_MAIN2	Enabled	PM_L4PER_TIMER10_WKDEP[0] WKUPDEP_TIMER10_MPU	Read/write
TIMER11	CD_L4_PER	CD_IPU, CD_L3_MAIN2	Disabled	PM_L4PER_TIMER11_WKDEP[1] WKUPDEP_TIMER11_IPU	Read/write
TIMER11	CD_L4_PER	CD_MPU, CD_L3_MAIN1, CD_L3_MAIN2	Disabled	PM_L4PER_TIMER11_WKDEP[0] WKUPDEP_TIMER11_MPU	Read/write
TIMER2	CD_L4_PER	CD_MPU, CD_L3_MAIN1, CD_L3_MAIN2	Enabled	PM_L4PER_TIMER2_WKDEP[0] WKUPDEP_TIMER2_MPU	Read/write
TIMER3	CD_L4_PER	CD_IPU, CD_L3_MAIN2	Disabled	PM_L4PER_TIMER3_WKDEP[1] WKUPDEP_TIMER3_IPU	Read/write
TIMER3	CD_L4_PER	CD_MPU, CD_L3_MAIN1, CD_L3_MAIN2	Disabled	PM_L4PER_TIMER3_WKDEP[0] WKUPDEP_TIMER3_MPU	Read/write
TIMER4	CD_L4_PER	CD_IPU, CD_L3_MAIN2	Disabled	PM_L4PER_TIMER4_WKDEP[1] WKUPDEP_TIMER4_IPU	Read/write

Table 3-117. CD_L4_PER Wake-Up Dependency Association Parameters (continued)

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
TIMER4	CD_L4_PER	CD_MPU, CD_L3_MAIN1, CD_L3_MAIN2	Disabled	PM_L4PER_TIMER4_WKDEP[0] WKUPDEP_TIMER4_MPU	Read/write
TIMER9	CD_L4_PER	CD_IPU, CD_L3_MAIN2	Disabled	PM_L4PER_TIMER9_WKDEP[1] WKUPDEP_TIMER9_IPU	Read/write
TIMER9	CD_L4_PER	CD_MPU, CD_L3_MAIN1, CD_L3_MAIN2	Disabled	PM_L4PER_TIMER9_WKDEP[0] WKUPDEP_TIMER9_MPU	Read/write
GPIO2	CD_L4_PER	CD_DSP, CD_L3_MAIN1, CD_L3_MAIN2	Enabled	PM_L4PER_GPIO2_WKDEP[6] WKUPDEP_GPIO2_IRQ2_DSP	Read/write
GPIO2	CD_L4_PER	CD_IPU, CD_L3_MAIN2	Disabled	PM_L4PER_GPIO2_WKDEP[1] WKUPDEP_GPIO2_IRQ1_IPU	Read/write
GPIO2	CD_L4_PER	CD_MPU, CD_L3_MAIN1, CD_L3_MAIN2	Disabled	PM_L4PER_GPIO2_WKDEP[0] WKUPDEP_GPIO2_IRQ1_MPU	Read/write
GPIO3	CD_L4_PER	CD_DSP, CD_L3_MAIN1, CD_L3_MAIN2	Enabled	PM_L4PER_GPIO3_WKDEP[6] WKUPDEP_GPIO3_IRQ2_DSP	Read/write
GPIO3	CD_L4_PER	CD_MPU, CD_L3_MAIN1, CD_L3_MAIN2	Disabled	PM_L4PER_GPIO3_WKDEP[0] WKUPDEP_GPIO3_IRQ1_MPU	Read/write
GPIO4	CD_L4_PER	CD_DSP, CD_L3_MAIN1, CD_L3_MAIN2	Enabled	PM_L4PER_GPIO4_WKDEP[6] WKUPDEP_GPIO4_IRQ2_DSP	Read/write

Table 3-119 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-119. CD_L4_PER Modules Wake-Up Request

Module	Wake-Up Feature
TIMER10	Slave wake-up request (MPU-IRQ)
TIMER11	Slave wake-up request (MPU-IRQ, IPU-IRQ)
TIMER2	Slave wake-up request (MPU-IRQ)
TIMER3	Slave wake-up request (MPU-IRQ, IPU-IRQ)
TIMER4	Slave wake-up request (MPU-IRQ, IPU-IRQ)
TIMER9	Slave wake-up request (MPU-IRQ, IPU-IRQ)
ELM	None
GPIO2	Slave wake-up request (MPU-IRQ, IPU-IRQ, DSP-IRQ)
GPIO3	Slave wake-up request (MPU-IRQ, DSP-IRQ)
GPIO4	Slave wake-up request (MPU-IRQ, DSP-IRQ)
GPIO5	Slave wake-up request (MPU-IRQ, DSP-IRQ)
GPIO6	Slave wake-up request (MPU-IRQ, DSP-IRQ)

Table 3-119. CD_L4_PER Modules Wake-Up Request (continued)

Module	Wake-Up Feature
GPIO7	Slave wake-up request (MPU-IRQ)
GPIO8	Slave wake-up request (MPU-IRQ)
HDQ1W	None
I2C1	Slave wake-up request (MPU-IRQ, IPU-IRQ, DMA_SYSTEM-DMA)
I2C2	Slave wake-up request (MPU-IRQ, IPU-IRQ, DMA_SYSTEM-DMA)
I2C3	Slave wake-up request (MPU-IRQ, IPU-IRQ, DMA_SYSTEM-DMA)
I2C4	Slave wake-up request (MPU-IRQ, IPU-IRQ, DMA_SYSTEM-DMA)
I2C5	Slave wake-up request (MPU-IRQ)
L4_PER interconnect	None
MCSPI1	Slave wake-up request (MPU-IRQ, IPU-IRQ, DSP-IRQ, DMA_SYSTEM-DMA)
MCSPI2	Slave wake-up request (MPU-IRQ, IPU-IRQ, DMA_SYSTEM-DMA)
MCSPI3	Slave wake-up request (MPU-IRQ, DMA_SYSTEM-DMA)
MCSPI4	Slave wake-up request (MPU-IRQ, DMA_SYSTEM -DMA)
MMC3	Slave wake-up request (MPU-IRQ, IPU-IRQ, DMA_SYSTEM-DMA)
MMC4	Slave wake-up request (MPU-IRQ, DMA_SYSTEM -DMA)
MMC5	Slave wake-up request (MPU-IRQ, DMA_SYSTEM-DMA)
UART1	Slave wake-up request (MPU-IRQ, DMA_SYSTEM-DMA)
UART2	Slave wake-up request (MPU-IRQ, DMA_SYSTEM-DMA)
UART3	Slave wake-up request (MPU-IRQ, IPU -IRQ, DSP-IRQ and DMA, DMA_SYSTEM-DMA)
UART4	Slave wake-up request (MPU-IRQ, DMA_SYSTEM-DMA)
UART5	Slave wake-up request (MPU-IRQ, DMA_SYSTEM-DMA)
UART6	Slave wake-up request (MPU-IRQ, DMA_SYSTEM-DMA)

Table 3-120 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-120. CD_L4_PER Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
TIMER10	Slave	CM_L4PER_TIMER10_CLKCTRL[17:16] IDLEST	Idle status
TIMER11	Slave	CM_L4PER_TIMER11_CLKCTRL[17:16] IDLEST	Idle status
TIMER2	Slave	CM_L4PER_TIMER2_CLKCTRL[17:16] IDLEST	Idle status
TIMER3	Slave	CM_L4PER_TIMER3_CLKCTRL[17:16] IDLEST	Idle status
TIMER4	Slave	CM_L4PER_TIMER4_CLKCTRL[17:16] IDLEST	Idle status
TIMER9	Slave	CM_L4PER_TIMER9_CLKCTRL[17:16] IDLEST	Idle status
ELM	Slave	CM_L4PER_ELM_CLKCTRL[17:16] IDLEST	Idle status
GPIO2	Slave	CM_L4PER_GPIO2_CLKCTRL[17:16] IDLEST	Idle status

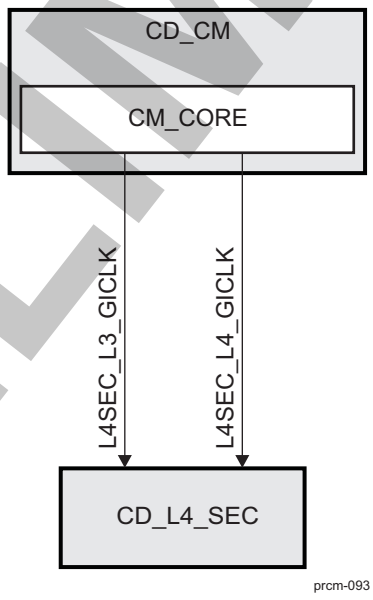
3.6.9 CD_L4_SEC Clock Domain

This section identifies the modes supported by the clock domain, the associated control, and status bits. It also identifies the dependencies of the domain with the other clock domains of the device.

3.6.9.1 Overview

Figure 3-61 shows an overview of the clock domain.

Figure 3-61. CD_L4_SEC Overview



3.6.9.2 Clock Domain Modes

Table 3-122 lists the clock domain modes supported by the clock domain.

Table 3-122. CD_L4_SEC Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-123 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-123. CD_L4_SEC Control and Status Parameters

Parameter Name	Control/Status Bit Field
L4SEC_L3_GICLK clock status	CM_L4SEC_CLKSTCTRL[8] CLKACTIVITY_L4SEC_L3_GICLK
L4SEC_L4_GICLK clock status	CM_L4SEC_CLKSTCTRL[9] CLKACTIVITY_L4SEC_L4_GICLK
Clock Domain State Transition Control	CM_L4SEC_CLKSTCTRL[1:0] CLKTRCTRL

3.6.9.3 Clock Domain Dependency

CD_L4_SEC has no module wake-up dependency with any other clock domain of the device.

3.6.9.3.1 Static Dependency

Table 3-124 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-124. CD_L4_SEC Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L4_PER	Disabled	CM_L4SEC_STATICDEP[13] L4PER_STATDEP	Read/Write
CD_L3_MAIN2	Always enabled	CM_L4SEC_STATICDEP[6] L3MAIN2_STATDEP	Read only
CD_L3_MAIN1	Disabled	CM_L4SEC_STATICDEP[5] L3MAIN1_STATDEP	Read/Write
CD_EMIF	Disabled	CM_L4SEC_STATICDEP[4] EMIF_STATDEP	Read/Write

3.6.9.3.2 Dynamic Dependency

Table 3-125 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-125. CD_L4_SEC Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN2	Always disabled	CM_L4SEC_DYNAMICDEP[6] L3MAIN2_DYNDEP	Read only

3.6.9.4 Clock Domain Module Attributes

Table 3-126 lists the clocks received by each module of the clock domain and the role (that is, functional clock or interface clock).

Table 3-126. CD_L4_SEC Modules Clocks Association

Module	Clock	Clock Type
AES1	L4SEC_L3_GICLK	Interface
AES2	L4SEC_L3_GICLK	Interface
SHA2MD5	L4SEC_L3_GICLK	Interface
CryptoDMA	L4SEC_L3_GICLK	Interface and Functional
	L4SEC_L4_GICLK	Interface
DES3DES	L4SEC_L4_GICLK	Interface
RNG	L4SEC_L4_GICLK	Interface
FPKA	L4SEC_L4_GICLK	Interface and Functional

Table 3-127 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-127. CD_L4_SEC Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
AES1	Slave	CM_L4SEC_AES1_CLKCTRL[17:16] IDLEST	Idle status
AES2	Slave	CM_L4SEC_AES2_CLKCTRL[17:16] IDLEST	Idle status
SHA2MD5	Slave	CM_L4SEC_SHA2MD5_CLKCTRL[17:16] IDLEST	Idle status
CryptoDMA	Master/Slave	CM_L4SEC_DMA_CRYPTO_CLKCTRL[18] STBYST	Standby status
		CM_L4SEC_DMA_CRYPTO_CLKCTRL [17:16] IDLEST	Idle status
DES3DES	Slave	CM_L4SEC_DES3DES_CLKCTRL[17:16] IDLEST	Idle status
RNG	Slave	CM_L4SEC_RNG_CLKCTRL[17:16] IDLEST	Idle status
FPKA	Slave	CM_L4SEC_FPKA_CLKCTRL[17:16] IDLEST	Idle status

NOTE: PRCM insures that DMA_CRYPTO idle sequence start only when AES1, AES2, SHA2MD5 and DES3DES modules are already in Idle state.

Table 3-128 lists the supported slave clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-128. CD_L4_SEC Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
AES1	Available	Available	N/A	CM_L4SEC_AES1_CLKCTRL[1:0] MODULEMODE	Read/Write
AES2	Available	Available	N/A	CM_L4SEC_AES2_CLKCTRL[1:0] MODULEMODE	Read/Write
SHA2MD5	Available	Available	N/A	CM_L4SEC_SHA2MD5_CLKCTRL[1:0] MODULEMODE	Read/Write
DMA_CRYPTO	N/A	Available	N/A	CM_L4SEC_DMA_CRYPTO_CLKCTRL[1:0] MODULEMODE	Read only
DES3DES	Available	Available	N/A	CM_L4SEC_DES3DES_CLKCTRL[1:0] MODULEMODE	Read/Write
RNG	Available	Available	N/A	CM_L4SEC_RNG_CLKCTRL[1:0] MODULEMODE	Read/Write
FPKA	Available	N/A	Available	CM_L4SEC_FPKA_CLKCTRL[1:0] MODULEMODE	Read/Write

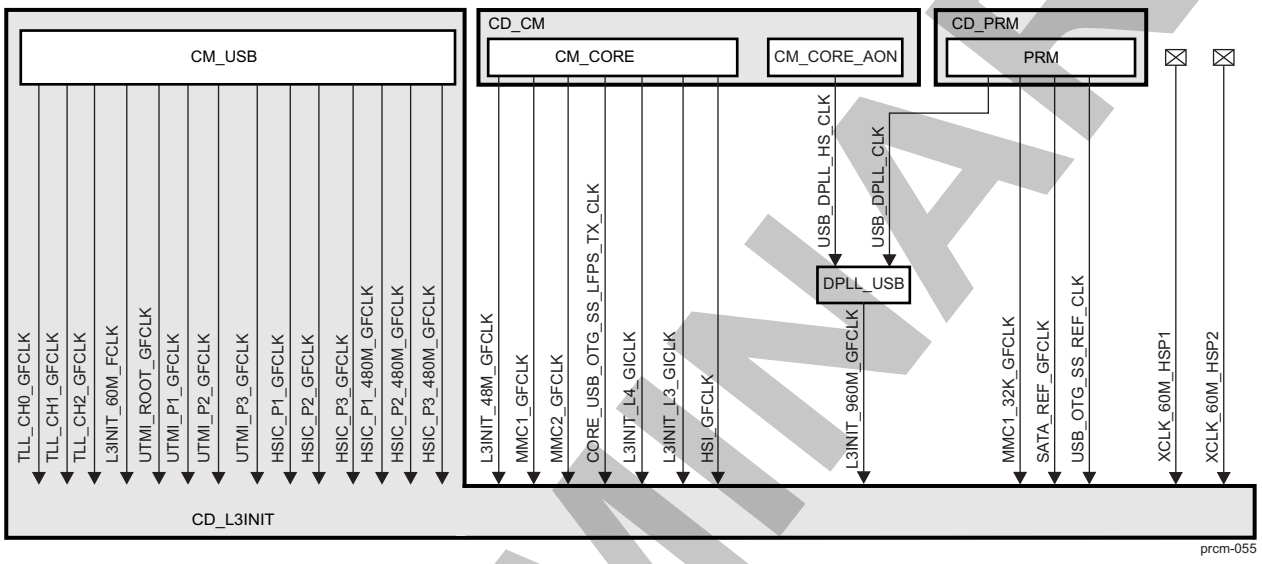
3.6.10 CD_L3INIT Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.10.1 Overview

Figure 3-62 is an overview of the clock domain.

Figure 3-62. CD_L3INIT Overview



3.6.10.2 Clock Domain Modes

Table 3-129 lists the clock domain modes supported by the clock domain.

Table 3-129. CD_L3INIT Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-130 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-130. CD_L3INIT Control and Status Parameters

Parameter Name	Control/Status Bit Field
HSIC_P1_480M_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[20] CLKACTIVITY_HSIC_P1_480M_GFCLK
HSIC_P1_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[26] CLKACTIVITY_HSIC_P1_GFCLK
HSIC_P2_480M_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[21] CLKACTIVITY_HSIC_P2_480M_GFCLK
HSIC_P2_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[27] CLKACTIVITY_HSIC_P2_GFCLK
HSIC_P3_480M_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[6] CLKACTIVITY_HSIC_P3_480M_GFCLK
HSIC_P3_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[7] CLKACTIVITY_HSIC_P3_GFCLK
USB_OTG_SS_REF_CLK Clock Status	CM_L3INIT_CLKSTCTRL[31] CLKACTIVITY_USB_OTG_SS_REF_CLK
USB_OTG_SS_REF_CLK Clock Control	CM_L3INIT_USB_OTG_SS_CLKCTRL[8] OPTFCLKEN_REFCLK960M
USB_DPLL_HS_CLK Clock Status	CM_L3INIT_CLKSTCTRL[15] CLKACTIVITY_USB_DPLL_HS_CLK

Table 3-130. CD_L3INIT Control and Status Parameters (continued)

Parameter Name	Control/Status Bit Field
USB_DPLL_CLK Clock Status	CM_L3INIT_CLKSTCTRL[14] CLKACTIVITY_USB_DPLL_CLK
L3INIT_48M_GFCLK Clock Statuss	CM_L3INIT_CLKSTCTRL[12] CLKACTIVITY_L3INIT_48M_GFCLK
L3INIT_60M_P1_FCLK Clock Status	CM_L3INIT_CLKSTCTRL[28] CLKACTIVITY_L3INIT_60M_P1_FCLK
L3INIT_60M_P2_FCLK Clock Status	CM_L3INIT_CLKSTCTRL[29] CLKACTIVITY_L3INIT_60M_P2_FCLK
HSI_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[16] CLKACTIVITY_HSI_GFCLK
MMC1_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[17] CLKACTIVITY_MMC1_GFCLK
MMC1_32K_GFCLK Optional functional clock control	CM_L3INIT_MMC1_CLKCTRL[8] OPTFCLKEN_32KHZ_CLK
MMC1_32K_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[2] CLKACTIVITY_MMC1_32K_GFCLK
MMC2_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[18] CLKACTIVITY_MMC2_GFCLK
SATA_REF_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[19] CLKACTIVITY_SATA_REF_GFCLK
L3INIT_L3_GICLK Clock Status	CM_L3INIT_CLKSTCTRL[8] CLKACTIVITY_L3INIT_L3_GICLK
L3INIT_L4_GICLK Clock Status	CM_L3INIT_CLKSTCTRL[9] CLKACTIVITY_L3INIT_L4_GICLK
TLL_CH0_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[22] CLKACTIVITY_TLL_CH0_GFCLK
TLL_CH1_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[23] CLKACTIVITY_TLL_CH1_GFCLK
TLL_CH2_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[24] CLKACTIVITY_TLL_CH2_GFCLK
UTMI_ROOT_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[25] CLKACTIVITY_UTMI_ROOT_GFCLK
UTMI_P3_GFCLK Clock Status	CM_L3INIT_CLKSTCTRL[30] CLKACTIVITY_UTMI_P3_GFCLK
XCLK60MHSP2 Clock Status	CM_L3INIT_CLKSTCTRL[4] CLKACTIVITY_PAD_XCLK60MHSP2
L3INIT_USB_OTG_SS_LFPS_TX_FCLK Clock Status	CM_L3INIT_CLKSTCTRL[11] CLKACTIVITY_L3INIT_USB_OTG_SS_LFPS_TX_FCLK
Clock Domain State Transition Control	CM_L3INIT_CLKSTCTRL[1:0] CLKTRCTRL

3.6.10.3 Clock Domain Dependency

3.6.10.3.1 Static Dependency

Table 3-131 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-131. CD_L3INIT Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Disabled	CM_L3INIT_STATICDEP[3] ABE_STATDEP	Read/write
CD_IVA	Disabled	CM_L3INIT_STATICDEP[2] IVA_STATDEP	Read/write
CD_L3_MAIN1	Always enabled	CM_L3INIT_STATICDEP[5] L3MAIN1_STATDEP	Read only
CD_L3_MAIN2	Always enabled	CM_L3INIT_STATICDEP[6] L3_MAIN2_STATDEP	Read only
CD_L4_CFG	Disabled	CM_L3INIT_STATICDEP[12] L4CFG_STATDEP	Read/write
CD_L4_PER	Disabled	CM_L3INIT_STATICDEP[13] L4PER_STATDEP	Read/write
CD_L4_SEC	Disabled	CM_L3INIT_STATICDEP[14] L4SEC_STATDEP	Read/write

Table 3-131. CD_L3INIT Static Dependency Association Parameters (continued)

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_EMIF	Disabled	CM_L3INIT_STATICDEP[4] EMIF_STATDEP	Read/write
CD_WKUPAON	Disabled	CM_L3INIT_STATICDEP[15] WKUPAON_STATDEP	Read/write

3.6.10.3.2 Dynamic Dependency

Table 3-132 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-132. CD_L3INIT Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN1	Always disabled	CM_L3INIT_DYNAMICDEP[5] L3MAIN1_DYNDEP	Read only
CD_L3_MAIN2	Always disabled	CM_L3INIT_DYNAMICDEP[6] L3MAIN2_DYNDEP	Read only

3.6.10.3.3 Wake-Up Dependency

Table 3-133 lists the wake-up dependency settings for the modules of this clock in the clock domain.

Table 3-133. CD_L3INIT Wake-Up Dependency Association Parameters

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
HSI	CD_L3INIT	CD_DSP, CD_L3_MAIN1, CD_L4_CFG	Enabled	PM_L3INIT_HSI_WKDEP[6] WKUPDEP_HSI_DSP_DSP	Read/write
HSI	CD_L3INIT	CD_IPU, CD_L3_MAIN2, CD_L3_MAIN1, CD_L4_CFG	Disabled	PM_L3INIT_HSI_WKDEP[1] WKUPDEP_HSI_MCU_IPU	Read/write
HSI	CD_L3INIT	CD_MPU, CD_L3_MAIN1, CD_L4_CFG	Disabled	PM_L3INIT_HSI_WKDEP[0] WKUPDEP_HSI_MCU_MPU	Read/write
MMC1	CD_L3INIT	CD_DMA, CD_L3_MAIN2, CD_L4_PER	Disabled	PM_L3INIT_MMC1_WKDEP[3] WKUPDEP_MMC1_SDMA	Read/write
MMC1	CD_L3INIT	CD_DSP, CD_L3_MAIN1, CD_L3_MAIN2, CD_L4_PER	Disabled	PM_L3INIT_MMC1_WKDEP[2] WKUPDEP_MMC1_DSP	Read/write
MMC1	CD_L3INIT	CD_IPU, CD_L3_MAIN2, CD_L4_PER	Disabled	PM_L3INIT_MMC1_WKDEP[1] WKUPDEP_MMC1_IPU	Read/write
MMC1	CD_L3INIT	CD_MPU, CD_L3_MAIN1, CD_L3_MAIN2, CD_L4_PER	Disabled	PM_L3INIT_MMC1_WKDEP[0] WKUPDEP_MMC1_MPU	Read/write
MMC2	CD_L3INIT	CD_DMA, CD_L3_MAIN2, CD_L4_PER	Disabled	PM_L3INIT_MMC2_WKDEP[3] WKUPDEP_MMC2_SDMA	Read/write

Table 3-133. CD_L3INIT Wake-Up Dependency Association Parameters (continued)

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
MMC2	CD_L3INIT	CD_DSP, CD_L3_MAIN1, CD_L3_MAIN2, CD_L4_PER	Disabled	PM_L3INIT_MMC2_WKDEP[2] WKUPDEP_MMC2_DSP	Read/write
MMC2	CD_L3INIT	CD_IPU, CD_L3_MAIN2, CD_L4_PER	Disabled	PM_L3INIT_MMC2_WKDEP[1] WKUPDEP_MMC2_IPU	Read/write
MMC2	CD_L3INIT	CD_MPU, CD_L3_MAIN1, CD_L4_PER	Disabled	PM_L3INIT_MMC2_WKDEP[0] WKUPDEP_MMC2_MPU	Read/write
USB_OTG_SS	CD_L3INIT	CD_IPU, CD_L3_MAIN1, CD_L3_MAIN2, CD_L4_CFG	Disabled	PM_L3INIT_USB_OTG_SS_WKDEP[1] WKUPDEP_USB_OTG_SS_IPU	Read/write
USB_OTG_SS	CD_L3INIT	CD_MPU, CD_L3_MIAN1, CD_L4_CFG	Disabled	PM_L3INIT_USB_OTG_SS_WKDEP[0] WKUPDEP_USB_OTG_SS_MPU	Read/write
USB_HOST_HS	CD_L3INIT	CD_IPU, CD_L3_MAIN1, CD_L3_MAIN2, CD_L4_CFG	Disabled	PM_L3INIT_USB_HOST_HS_WKDEP[1] WKUPDEP_USB_HOST_HS_IPU	Read/write
USB_HOST_HS	CD_L3INIT	CD_MPU, CD_L3_MAIN1, CD_L4_CFG	Disabled	PM_L3INIT_USB_HOST_HS_WKDEP[0] WKUPDEP_USB_HOST_HS_MPU	Read/write
USB_TLL_HS	CD_L3INIT	CD_IPU, CD_L3_MAIN1, CD_L3_MAIN2, CD_L4_CFG	Disabled	PM_L3INIT_USB_TLL_HS_WKDEP[1] WKUPDEP_USB_TLL_HS_IPU	Read/write
USB_TLL_HS	CD_L3INIT	CD_MPU, CD_L3_MAIN1, CD_L4_CFG	Disabled	PM_L3INIT_USB_TLL_HS_WKDEP[0] WKUPDEP_USB_TLL_HS_MPU	Read/write
SATA	CD_L3INIT	CD_MPU, CD_L3_MAIN1, CD_L4_CFG	Disabled	PM_L3INIT_SATA_WKDEP[0] WKUPDEP_SATA_MPU	Read/write

3.6.10.4 Clock Domain Module Attributes

Table 3-134 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-134. CD_L3INIT Modules Clocks Association

Module	Clock	Clock Type
HSI	HSI_GFCLK	Interface and functional
	L3INIT_L3_GICLK	Interface
	L3INIT_L4_GICLK	Interface
IEEE1500_2_OCP	L3INIT_L3_GICLK	Interface and functional
	L3INIT_L4_GICLK	Interface
MMC1	MMC1_GFCLK	Functional
	MMC1_32K_GFCLK	Functional
	L3INIT_L3_GICLK	Interface

Table 3-134. CD_L3INIT Modules Clocks Association (continued)

Module	Clock	Clock Type
	L3INIT_L4_GICLK	Interface
MMC2	MMC2_GFCLK	Functional
	L3INIT_L3_GICLK	Interface
	L3INIT_L4_GICLK	Interface
USB_OTG_SS	L3INIT_960M_GFCLK	Functional
	L3INIT_L3_GICLK	Interface
	L3INIT_L4_GICLK	Interface
	USB_OTG_SS_REF_CLK	Reference clock for the DPLL_USB_OTG_SS (not managed by the PRCM module)
	CORE_USB_OTG_SS_LFPS_TX_CLK	Interface
USB_HOST_HS	HSIC_P1_480M_GFCLK	Functional
	HSIC_P1_GFCLK	Functional
	HSIC_P2_480M_GFCLK	Functional
	HSIC_P2_GFCLK	Functional
	HSIC_P3_480M_GFCLK	Functional
	HSIC_P3_GFCLK	Functional
	L3INIT_48M_GFCLK	Functional (mandatory)
	L3INIT_48M_GFCLK	Functional (optional)
	L3INIT_L3_GICLK	Interface
	L3INIT_L4_GICLK	Interface
	UTMI_P1_GFCLK	Functional
	UTMI_P2_GFCLK	Functional
	UTMI_P3_GFCLK	Functional
	UTMI_ROOT_GFCLK	Functional
USB_TLL_HS	L3INIT_L4_GICLK	Interface
	TLL_CH0_GFCLK	Functional
	TLL_CH1_GFCLK	Functional
	TLL_CH2_GFCLK	Functional
OCP2SCP1	L3INIT_L4_GICLK	Interface
OCP2SCP3	L3INIT_L4_GICLK	Interface
SATA	L3INIT_L3_GICLK	Interface
	L3INIT_48M_GFCLK	Functional
	SATA_REF_GFCLK	Functional

Table 3-135 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-135. CD_L3INIT Modules Wake-Up Request

Module	Wake-Up Feature
HSI	Slave wake-up request (MPU-IRQ, IPU-IRQ, DSP-IRQ)/Master wake-up request
MMC1	Slave wake-up request (MPU-IRQ, IPU-IRQ, DSP-IRQ, DMA_SYSTEM-DMA)
MMC2	Slave wake-up request (MPU-IRQ, IPU-IRQ, DSP-IRQ, DMA_SYSTEM-DMA)
DPLL_USB, OCP2SCP1, OCP2SCP3	None
IEEE1500_2_OCP	Master wake-up request
USB_OTG_SS	Slave wake-up request (MPU-IRQ, IPU-IRQ)

Table 3-135. CD_L3INIT Modules Wake-Up Request (continued)

Module	Wake-Up Feature
USB_HOST_HS	Slave wake-up request (MPU-IRQ, IPU-IRQ)
USB_TLL_HS	Slave wake-up request (MPU-IRQ, IPU-IRQ)
SATA	Slave wake-up request (MPU-IRQ)/Master wake-up request

Table 3-136 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-136. CD_L3INIT Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
HSI	Slave/master	CM_L3INIT_HSI_CLKCTRL[18] STBYST	Standby status
		CM_L3INIT_HSI_CLKCTRL[17:16] IDLEST	Idle status
IEEE1500_2_OCP	Slave/master	CM_L3INIT_IEEE1500_2_OCP_CLKCTRL[18] STBYST	Standby status
		CM_L3INIT_IEEE1500_2_OCP_CLKCTRL[17:16] IDLEST	Idle status
MMC1	Master/slave	CM_L3INIT_MMC1_CLKCTRL[18] STBYST	Standby status
		CM_L3INIT_MMC1_CLKCTRL[17:16] IDLEST	Idle status
MMC2	Master/slave	CM_L3INIT_MMC2_CLKCTRL[18] STBYST	Standby status
		CM_L3INIT_MMC2_CLKCTRL[17:16] IDLEST	Idle status
USB_OTG_SS	Slave/master	CM_L3INIT_USB_OTG_SS_CLKCTRL[18] STBYST	Standby status
		CM_L3INIT_USB_OTG_SS_CLKCTRL[17:16] IDLEST	Idle status
USB_HOST_HS	Slave/master	CM_L3INIT_USB_HOST_HS_CLKCTRL[18] STBYST	Standby status
		CM_L3INIT_USB_HOST_HS_CLKCTRL[17:16] IDLEST	Idle status

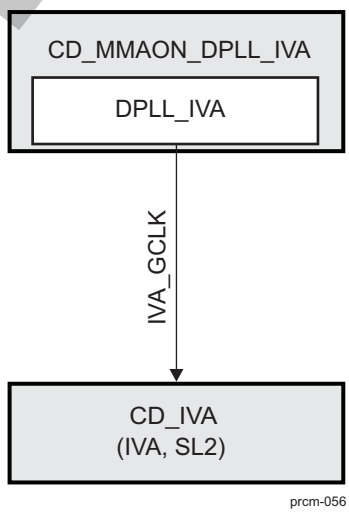
3.6.11 CD_IVA Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.11.1 Overview

Figure 3-63 is an overview of the clock domain.

Figure 3-63. CD_IVA Overview



3.6.11.2 Clock Domain Modes

Table 3-138 lists the clock domain modes supported by the clock domain.

Table 3-138. CD_IVA Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-139 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-139. CD_IVA Control and Status Parameters

Parameter Name	Control/Status Bit Field
IVA_GCLK Clock Status	CM_IVA_CLKSTCTRL[8] CLKACTIVITY_IVA_GCLK
Clock Domain State Transition Control	CM_IVA_CLKSTCTRL[1:0] CLKTRCTRL

3.6.11.3 Clock Domain Dependency

CD_IVA has no module wake-up dependency with any other clock domain of the device.

3.6.11.3.1 Static Dependency

Table 3-140 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-140. CD_IVA Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN1	Disabled	CM_IVA_STATICDEP[5] L3MAIN1_STATDEP	Read/write
CD_L3_MAIN2	Always enabled	CM_IVA_STATICDEP[6] L3MAIN2_STATDEP	Read only
CD_EMIF	Disabled	CM_IVA_STATICDEP[4] EMIF_STATDEP	Read/write

3.6.11.3.2 Dynamic Dependency

Table 3-141 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-141. CD_IVA Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN2	Alway disabled	CM_IVA_DYNAMICDEP[6] L3MAIN2_DYNDEP	Read only

3.6.11.4 Clock Domain Module Attributes

Table 3-142 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-142. CD_IVA Modules Clocks Association

Module	Clock	Clock Type
IVA	IVA_GCLK	Interface and functional
SL2	IVA_GCLK	Interface

Table 3-143 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-143. CD_IVA Modules Wake-Up Request

Module	Wake-Up Feature
IVA	None
SL2	None

Table 3-144 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-144. CD_IVA Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
IVA	Master/Slave	CM_IVA_IVA_CLKCTRL[18] STBYST	Standby status
		CM_IVA_IVA_CLKCTRL[17:16] IDLEST	Idle status
SL2	Slave	CM_IVA_SL2_CLKCTRL[17:16] IDLEST	Idle status

Table 3-145 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-145. CD_IVA Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
IVA	Available	Available	N/A	CM_IVA_IVA_CLKCTRL[1:0] MODULEMODE	Read/write
SL2	Available	Available	N/A	CM_IVA_SL2_CLKCTRL[1:0] MODULEMODE	Read/write

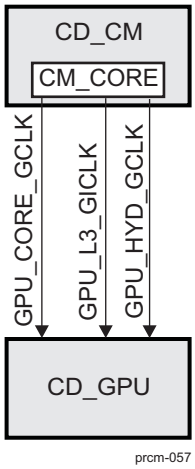
3.6.12 CD_GPU Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.12.1 Overview

Figure 3-64 is an overview of the clock domain.

Figure 3-64. CD_GPU Overview



3.6.12.2 Clock Domain Modes

Table 3-146 lists the clock domain modes supported by the clock domain.

Table 3-146. CD_GPU Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-147 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-147. CD_GPU Control and Status Parameters

Parameter Name	Control/Status Bit Field
GPU_L3_GICLK clock status	CM_GPU_CLKSTCTRL[8] CLKACTIVITY_GPU_L3_GICLK
Select the ratio of GPU_L3_GICLK (SYS_CLK) to L3_ICLK	CM_GPU_GPU_CLKCTRL[26] CLKSEL_GPU_SYS_CLK
GPU_CORE_GCLK clock status	CM_GPU_CLKSTCTRL[9] CLKACTIVITY_GPU_CORE_GCLK
Select the source of GPU_CORE_GCLK	CM_GPU_GPU_CLKCTRL[24] CLKSEL_GPU_CORE_GCLK
GPU_HYD_GCLK clock status	CM_GPU_CLKSTCTRL[10] CLKACTIVITY_GPU_HYD_GCLK
Select the source of GPU_HYD_GCLK	CM_GPU_GPU_CLKCTRL[25] CLKSEL_GPU_HYD_GCLK
Clock Domain State Transition Control	CM_GPU_CLKSTCTRL[1:0] CLKTRCTRL

3.6.12.3 Clock Domain Dependency

CD_GPU has no module wake-up dependency with any other clock domain of the device.

3.6.12.3.1 Static Dependency

Table 3-148 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-148. CD_GPU Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_IVA	Disabled	CM_GPU_STATICDEP[2] IVA_STATDEP	Read/write
CD_L3_MAIN1	Disabled	CM_GPU_STATICDEP[5] L3MAIN1_STATDEP	Read/write

Table 3-148. CD_GPU Static Dependency Association Parameters (continued)

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN2	Always enabled	CM_GPU_STATICDEP[6] L3MAIN2_STATDEP	Read only
CD_EMIF	Disabled	CM_GPU_STATICDEP[4] EMIF_STATDEP	Read/write

3.6.12.3.2 Dynamic Dependency

Table 3-149 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-149. CD_GPU Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN2	Alway disabled	CM_GPU_DYNAMICDEP[6] L3MAIN2_DYNDEP	Read only

3.6.12.4 Clock Domain Module Attributes

Table 3-150 identifies for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-150. CD_GPU Modules Clocks Association

Module	Clock	Clock Type
GPU	GPU_L3_GICLK	Interface
	GPU_CORE_GCLK	Functional
	GPU_HYD_GCLK	Functional

Table 3-151 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-151. CD_GPU Modules Wake-Up Request

Module	Wake-Up Feature
GPU	None

Table 3-152 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-152. CD_GPU Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
GPU	Master/slave	CM_GPU_GPU_CLKCTRL[18] STBYST	Standby status
		CM_GPU_GPU_CLKCTRL[17:16] IDLEST	Idle status

Table 3-153 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-153. CD_GPU Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
GPU	Available	N/A	Available	CM_GPU_GPU_CLKCTRL[1:0] MODULEMODE	Read/write

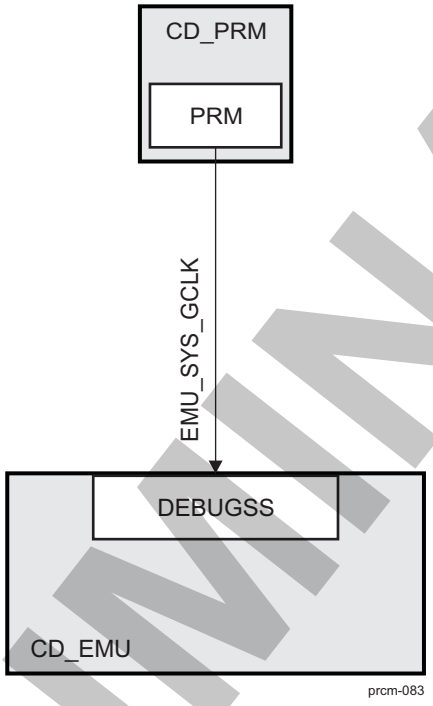
3.6.13 CD_EMU Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.13.1 Overview

Figure 3-65 is an overview of the clock domain.

Figure 3-65. CD_EMU Overview



3.6.13.2 Clock Domain Modes

Table 3-154 lists the clock domain modes supported by the clock domain.

Table 3-154. CD_EMU Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Not available	Not available	Available	Available

Table 3-155 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-155. CD_EMU Control and Status Parameters

Parameter Name	Control/Status Bit Field
EMU_SYS_GCLK Clock Status	CM_EMU_CLKSTCTRL[8] CLKACTIVITY_EMU_SYS_GCLK
Clock Domain State Transition Control	CM_EMU_CLKSTCTRL[1:0] CLKTRCTRL

3.6.13.3 Clock Domain Dependency

CD_EMU has no static or module wake-up dependency with any other clock domain of the device.

3.6.13.3.1 Dynamic Dependency

Table 3-156 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-156. CD_EMU Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN2	Always enabled	CM_EMU_DYNAMICDEP[6] L3MAIN2_DYNDEP	Read only

3.6.13.4 Clock Domain Module Attributes

Table 3-157 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-157. CD_EMU Modules Clocks Association

Module	Clock	Clock Type
DEBUGSS	EMU_SYS_GCLK	Interface and functional

Table 3-158 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-158. CD_EMU Modules Wake-Up Request

Module	Wake-Up Feature
DEBUGSS	Master wake-up request

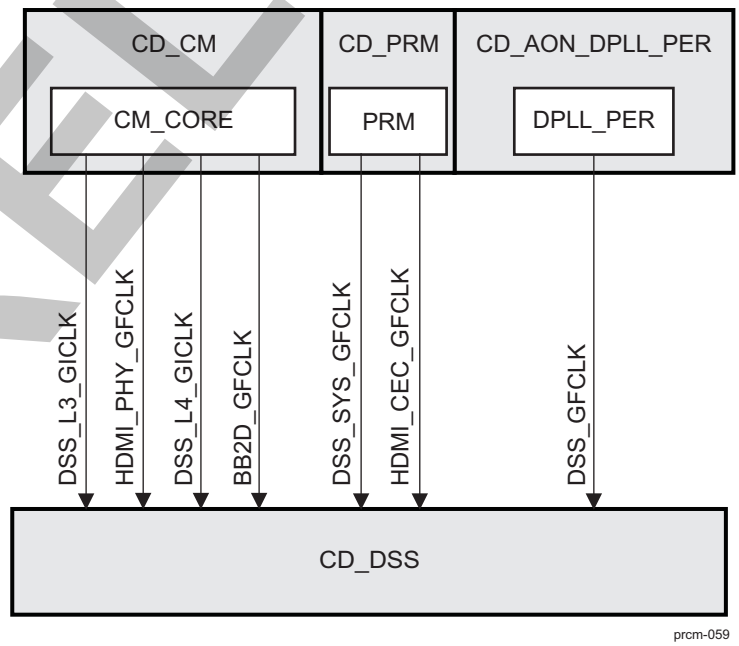
3.6.14 CD_DSS Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device. BB2D is a part of CD_DSS clock domain. BB2D_GFCLK is the functional clock for BB2D module. It is derived from H24 post divider of DPLL_CORE.

3.6.14.1 Overview

Figure 3-66 is an overview of the clock domain.

Figure 3-66. CD_DSS Overview



3.6.14.2 Clock Domain Modes

Table 3-159 lists the clock domain modes supported by the clock domain.

Table 3-159. CD_DSS Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-160 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-160. CD_DSS Control and Status Parameters

Parameter Name	Control/Status Bit Field
DSS_SYS_GFCLK Clock Status	CM_DSS_CLKSTCTRL[10] CLKACTIVITY_DSS_SYS_GFCLK
DSS_SYS_GFCLK Clock Control	CM_DSS_DSS_CLKCTRL[10] OPTFCLKEN_SYS_CLK
DSS_GFCLK Clock Status	CM_DSS_CLKSTCTRL[9] CLKACTIVITY_DSS_GFCLK
DSS_GFCLK Clock Control	CM_DSS_DSS_CLKCTRL[8] OPTFCLKEN_DSSCLK
HDMI_PHY_GFCLK Clock Status	CM_DSS_CLKSTCTRL[11] CLKACTIVITY_HDMI_PHY_GFCLK
HDMI_PHY_GFCLK Clock Control	CM_DSS_DSS_CLKCTRL[9] OPTFCLKEN_48MHZ_CLK
HDMI_CEC_GFCLK Clock Status	CM_DSS_CLKSTCTRL[12] CLKACTIVITY_HDMI_CEC_GFCLK
HDMI_CEC_GFCLK Clock Control	CM_DSS_DSS_CLKCTRL[11] OPTFCLKEN_32KHZ_CLK
BB2D_GFCLK Clock Control	CM_DSS_CLKSTCTRL[13] CLKACTIVITY_BB2D_GFCLK
DSS_L3_GICLK and DSS_L4_GICLK Clock Status	CM_DSS_CLKSTCTRL[8] CLKACTIVITY_DSS_L3_GICLK
Clock Domain State Transition Control	CM_DSS_CLKSTCTRL[1:0] CLKTRCTRL

3.6.14.3 Clock Domain Dependency

3.6.14.3.1 Static Dependency

Table 3-161 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-161. CD_DSS Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_IVA	Disabled	CM_DSS_STATICDEP[2] IVA_STATDEP	Read/write
CD_L3_MAIN1	Always enabled	CM_DSS_STATICDEP[5] L3MAIN1_STATDEP	Read only
CD_L3_MAIN2	Enabled	CM_DSS_STATICDEP[6] L3MAIN2_STATDEP	Read/write
CD_EMIF	Disabled	CM_DSS_STATICDEP[4] EMIF_STATDEP	Read/write

3.6.14.3.2 Dynamic Dependency

Table 3-162 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-162. CD_DSS Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN1	Alway disabled	CM_DSS_DYNAMICDEP[5] L3MAIN1_DYNDEP	Read only
CD_L3_MAIN2	Alway disabled	CM_DSS_DYNAMICDEP[6] L3MAIN2_DYNDEP	Read only

3.6.14.3.3 Wake-Up Dependency

Table 3-163 lists the wake-up dependency settings for the modules of this clock in the clock domain

Table 3-163. CD_DSS Wake-Up Dependency Association Parameters

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
DSS-DSI1_A	CD_DSS	CD_DMA, CD_L3_MAIN2	Disabled	PM_DSS_DSS_WKDEP[7] WKUPDEP_DSI1_A_SDMA	Read/write
DSS-DSI1_A	CD_DSS	CD_DSP, CD_L3_MAIN1, CD_L3_MAIN2	Disabled	PM_DSS_DSS_WKDEP[6] WKUPDEP_DSI1_A_DSP	Read/write
DSS-DSI1_A	CD_DSS	CD_IPU, CD_L3_MAIN2	Disabled	PM_DSS_DSS_WKDEP[5] WKUPDEP_DSI1_A_IPU	Read/write
DSS-DSI1_A	CD_DSS	CD_MPU, CD_L3_MAIN1, CD_L3_MAIN2	Disabled	PM_DSS_DSS_WKDEP[4] WKUPDEP_DSI1_A_MPU	Read/write
DSS-DSI1_C	CD_DSS	CD_IPU, CD_L3_MAIN2	Disabled	PM_DSS_DSS_WKDEP[16] WKUPDEP_DSI1_C_IPU	Read/write
DSS-DSI1_C	CD_DSS	CD_MPU, CD_L3_MAIN1, CD_L3_MAIN2	Disabled	PM_DSS_DSS_WKDEP[15] WKUPDEP_DSI1_C_MPU	Read/write
DSS-DSI1_C	CD_DSS	CD_DMA, CD_L3_MAIN2	Disabled	PM_DSS_DSS_WKDEP[18] WKUPDEP_DSI1_C_SDMA	Read/write
DSS-DSI1_C	CD_DSS	CD_DSP, CD_L3_MAIN1, CD_L3_MAIN2	Disabled	PM_DSS_DSS_WKDEP[17] WKUPDEP_DSI1_C_DSP	Read/write
DSS-HDMI	CD_DSS	CD_DMA, CD_L3_MAIN2	Enabled	PM_DSS_DSS_WKDEP[19] WKUPDEP_HDMIDMA_SDMA	Read/write
DSS-HDMI	CD_DSS	CD_DSP, CD_L3_MAIN1, CD_L3_MAIN2	Disabled	PM_DSS_DSS_WKDEP[14] WKUPDEP_HDMIIRQ_DSP	Read/write
DSS-HDMI	CD_DSS	CD_IPU, CD_L3_MAIN2	Disabled	PM_DSS_DSS_WKDEP[13] WKUPDEP_HDMIIRQ_IPU	Read/write
DSS-HDMI	CD_DSS	CD_MPU, CD_L3_MAIN1, CD_L3_MAIN2	Disabled	PM_DSS_DSS_WKDEP[12] WKUPDEP_HDMIIRQ_MPU	Read/write
DSS-DISPC	CD_DSS	CD_IPU, CD_L3_MAIN2	Disabled	PM_DSS_DSS_WKDEP[1] WKUPDEP_DISPC_IPU	Read/write
DSS-DISPC	CD_DSS	CD_MPU, CD_L3_MAIN1, CD_L3_MAIN2	Disabled	PM_DSS_DSS_WKDEP[0] WKUPDEP_DISPC_MPU	Read/write

Table 3-163. CD_DSS Wake-Up Dependency Association Parameters (continued)

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
DSS-DISPC	CD_DSS	CD_DSP, CD_L3_MAIN1, CD_L3_MAIN2	Disabled	PM_DSS_DSS_WKDEP[2] WKUPDEP_DISPC_DSP	Read/write
DSS-DISPC	CD_DSS	CD_DMA, CD_L3_MAIN2	Disabled	PM_DSS_DSS_WKDEP[3] WKUPDEP_DISPC_SDMA	Read/write

3.6.14.4 Clock Domain Module Attributes

Table 3-164 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-164. CD_DSS Modules Clocks Association

Module	Clock	Clock Type
DSS	DSS_SYS_GFCLK	Functional
	DSS_GFCLK	Functional
	HDMI_PHY_GFCLK	Functional
	HDMI_CEC_GFCLK	Functional
	DSS_L3_GICLK	Interface
	DSS_L4_GICLK	Interface
BB2D	BB2D_GFCLK	Functional
	DSS_L3_GICLK	Interface

Table 3-165 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-165. CD_DSS Modules Wake-Up Request

Module	Wake-Up Feature
DSS	Slave wake-up request (MPU-IRQ, IPU-IRQ, DSP-IRQ, DMA_SYSTEM-DMA)
BB2D	None

Table 3-166 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-166. CD_DSS Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
DSS	Master/slave	CM_DSS_DSS_CLKCTRL[18] STBYST	Standby status
		CM_DSS_DSS_CLKCTRL[17:16] IDLEST	Idle status
BB2D	Master/slave	CM_DSS_BB2D_CLKCTRL[18] STBYST	Standby status
		CM_DSS_BB2D_CLKCTRL[17:16] IDLEST	Idle status

Table 3-167 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-167. CD_DSS Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
DSS	Available	N/A	Available	CM_DSS_DSS_CLKCTRL[1:0] MODULEMODE	Read/write
BB2D	Available	N/A	Available	CM_DSS_BB2D_CLKCTRL[1:0] MODULEMODE	Read/write

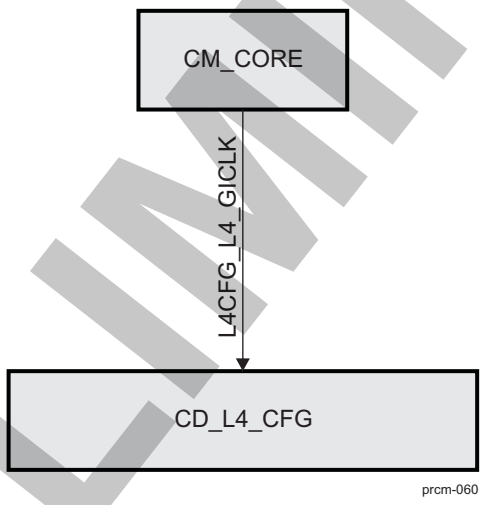
3.6.15 CD_L4_CFG Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.15.1 Overview

Figure 3-67 is an overview of the clock domain.

Figure 3-67. CD_L4_CFG Overview



3.6.15.2 Clock Domain Modes

Table 3-168 lists the clock domain modes supported by the clock domain.

Table 3-168. CD_L4_CFG Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Not available	Available

Table 3-169 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-169. CD_L4_CFG Control and Status Parameters

Parameter Name	Control/Status Bit Field
L4CFG_L4_GICLK Clock Status	CM_L4CFG_CLKSTCTRL[8] CLKACTIVITY_L4CFG_L4_GICLK
Clock Domain State Transition Control	CM_L4CFG_CLKSTCTRL[1:0] CLKTRCTRL

3.6.15.3 Clock Domain Dependency

CD_L4_CFG has no static or module wake-up dependency with any other clock domain of the device.

3.6.15.3.1 Dynamic Dependency

Table 3-170 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-170. CD_L4_CFG Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_CUSTEFUSE	Always enabled	CM_L4CFG_DYNAMICDEP[17] CUSTEFUSE_DYNDEP	Read only
CD_CAM	Alway disabled	CM_L4CFG_DYNAMICDEP[9] CAM_DYNDEP	Read only
CD_L3_MAIN1	Always enabled	CM_L4CFG_DYNAMICDEP[5] L3MAIN1_DYNDEP	Read only
CD_L3_MAIN2	Always enabled	CM_L4CFG_DYNAMICDEP[6] L3MAIN2_DYNDEP	Read only
CD_L3INIT	Always enabled	CM_L4CFG_DYNAMICDEP[7] L3INIT_DYNDEP	Read only
CD_EMIF	Always enabled	CM_L4CFG_DYNAMICDEP[4] EMIF_DYNDEP	Read only
CD_DMA	Always enabled	CM_L4CFG_DYNAMICDEP[11] SDMA_DYNDEP	Read only
CD_DSP	Always enabled	CM_L4CFG_DYNAMICDEP[1] DSP_DYNDEP	Read only
CD_MPU	Always enabled	CM_L4CFG_DYNAMICDEP[19] MPU_DYNDEP	Read only
CD_COREAON	Always enabled	CM_L4CFG_DYNAMICDEP[16] COREAON_DYNDEP	Read only

3.6.15.4 Clock Domain Module Attributes

Table 3-171 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-171. CD_L4_CFG Modules Clocks Association

Module	Clock	Clock Type
CTRL_MODULE_CORE	L4CFG_L4_GICLK	Functional
SPINLOCK	L4CFG_L4_GICLK	Interface
L4_CFG interconnect	L4CFG_L4_GICLK	Interface
MAILBOX	L4CFG_L4_GICLK	Interface
SAR_ROM	L4CFG_L4_GICLK	Interface

Table 3-172 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-172. CD_L4_CFG Modules Wake-Up Request

Module	Wake-Up Feature
CONTROL_MODULE_CORE	None
SPINLOCK	None
L4_CFG interconnect	None
MAILBOX	None
SAR_ROM	None

Table 3-173 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-173. CD_L4_CFG Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
SPINLOCK	Slave	CM_L4CFG_SPINLOCK_CLKCTRL[17:16] IDLEST	Idle status
L4_CFG interconnect	Slave	CM_L4CFG_L4_CFG_CLKCTRL[17:16] IDLEST	Idle status
MAILBOX	Slave	CM_L4CFG_MAILBOX_CLKCTRL[17:16] IDLEST	Idle status
SAR_ROM	Slave	CM_L4CFG_SAR_ROM_CLKCTRL[17:16] IDLEST	Idle status

Table 3-174 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-174. CD_L4_CFG Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
SPINLOCK	N/A	Available	N/A	CM_L4CFG_SPINLOCK_CLKCTRL[1:0] MODULEMODE	Read only
L4_CFG interconnect	N/A	Available	N/A	CM_L4CFG_L4_CFG_CLKCTRL[1:0] MODULEMODE	Read only
MAILBOX	N/A	Available	N/A	CM_L4CFG_MAILBOX_CLKCTRL[1:0] MODULEMODE	Read only
SAR_ROM	N/A	Available	N/A	CM_L4CFG_SAR_ROM_CLKCTRL[1:0] MODULEMODE	Read only

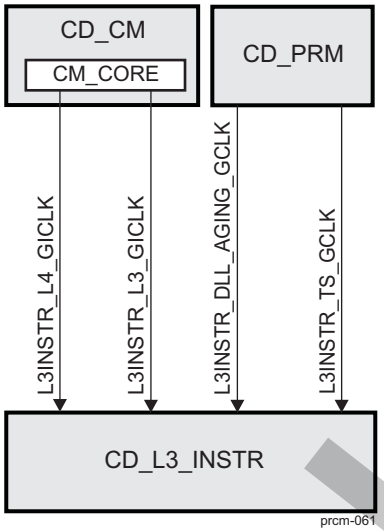
3.6.16 CD_L3_INSTR Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.16.1 Overview

Figure 3-68 is an overview of the clock domain.

Figure 3-68. CD_L3_INSTR Overview



3.6.16.2 Clock Domain Modes

Table 3-175 lists the clock domain modes supported by the clock domain.

Table 3-175. CD_L3_INSTR Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Not available	Not available	Not available	Available

Table 3-176 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-176. CD_L3_INSTR Control and Status Parameters

Parameter Name	Control/Status Bit Field
L3INSTR_L3_GICLK Clock Status	CM_L3INSTR_CLKSTCTRL[8] CLKACTIVITY_L3INSTR_L3_GICLK
L3INSTR_DLL_AGING_GCLK Clock Status	CM_L3INSTR_CLKSTCTRL[9] CLKACTIVITY_L3INSTR_DLL_AGING_GCLK
L3INSTR_TS_GCLK Clock Status	CM_L3INSTR_CLKSTCTRL[10] CLKACTIVITY_L3INSTR_TS_GCLK
Clock Domain State Transition Control	CM_L3INSTR_CLKSTCTRL[1:0] CLKTRCTRL

3.6.16.3 Clock Domain Dependency

CD_L3_INSTR has no static, dynamic, or module wake-up dependency with any other clock domain of the device.

For aging, DLL requires a low-frequency clock that must run as long as the CORE power domain is on. To match this requirement, the DLL_AGING module has been created and instantiated in this clock domain, which is the last to transition in low-power state.

3.6.16.4 Clock Domain Module Attributes

Table 3-177 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-177. CD_L3_INSTR Modules Clocks Association

Module	Clock	Clock Type
L3_MAIN_3 interconnect	L3INSTR_L3_GICLK	Interface
	L3INSTR_L4_GICLK	Interface
L3_INSTR interconnect	L3INSTR_L3_GICLK	Interface
OCP_WP_NOC	L3INSTR_L3_GICLK	Interface
	L3INSTR_L4_GICLK	Interface
DLL_AGING	L3INSTR_DLL_AGING_GCLK	Interface
CTRL_MODULE_BANDGAP	L3INSTR_TS_GCLK	Interface

Table 3-178 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-178. CD_L3_INSTR Modules Wake-Up Request

Module	Wake-Up Feature
L3_MAIN_3 interconnect	None
L3_INSTR interconnect	None
OCP_WP_NOC	None
DLL_AGING	None
CTRL_MODULE_BANDGAP	None

Table 3-179 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-179. CD_L3_INSTR Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
L3_MAIN_3 interconnect	Slave	CM_L3INSTR_L3_MAIN_3_CLKCTRL[17:16] IDLEST	Idle status
L3_INSTR interconnect	Slave	CM_L3INSTR_L3_INSTR_CLKCTRL[17:16] IDLEST	Idle status
OCP_WP_NOC	Slave	CM_L3INSTR_OCP_WP_NOC_CLKCTRL[17:16] IDLEST	Idle status
DLL_AGING	Slave	CM_L3INSTR_DLL_AGING_CLKCTRL[17:16] IDLEST	Idle status
CTRL_MODULE_BANDGAP	Slave	CM_L3INSTR_CTRL_MODULE_BANDGAP_CLKCTRL[17:16] IDLEST	Idle status

Table 3-180 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-180. CD_L3_INSTR Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
L3_MAIN_3 interconnect	Available	Available	N/A	CM_L3INSTR_L3_MAIN_3_CLKCTRL[1:0] MODULEMODE	Read/write
L3_INSTR interconnect	Available	Available	N/A	CM_L3INSTR_L3_INSTR_CLKCTRL[1:0] MODULEMODE	Read/write
OCP_WP_NOC	Available	Available	N/A	CM_L3INSTR_OCP_WP_NOC_CLKCTRL[1:0] MODULEMODE	Read/write
DLL_AGING	N/A	Available	N/A	CM_L3INSTR_DLL_AGING_CLKCTRL[1:0] MODULEMODE	Read only

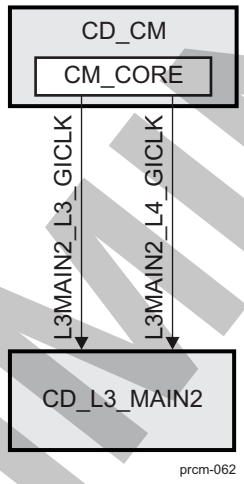
3.6.17 CD_L3_MAIN2 Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.17.1 Overview

Figure 3-69 is an overview of the clock domain.

Figure 3-69. CD_L3_MAIN2 Overview



3.6.17.2 Clock Domain Modes

Table 3-181 lists the clock domain modes supported by the clock domain.

Table 3-181. CD_L3_MAIN2 Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Not available	Available

Table 3-182 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-182. CD_L3_MAIN2 Control and Status Parameters

Parameter Name	Control/Status Bit Field
L3MAIN2_L3_GICLK Clock Status	CM_L3MAIN2_CLKSTCTRL[8] CLKACTIVITY_L3MAIN2_L3_GICLK
Clock Domain State Transition Control	CM_L3MAIN2_CLKSTCTRL[1:0] CLKTRCTRL

3.6.17.3 Clock Domain Dependency

CD_L3_MAIN2 has no static or module wake-up dependency with any other clock domain of the device.

3.6.17.3.1 Dynamic Dependency

Table 3-183 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-183. CD_L3_MAIN2 Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_DSS	Always enabled	CM_L3MAIN2_DYNAMICDEP[8] DSS_DYNDEP	Read only
CD_IPU	Always enabled	CM_L3MAIN2_DYNAMICDEP[0] IPU_DYNDEP	Read only
CD_GPU	Always enabled	CM_L3MAIN2_DYNAMICDEP[10] GPU_DYNDEP	Read only
CD_CAM	Alway disabled	CM_L3MAIN2_DYNAMICDEP[9] CAM_DYNDEP	Read only
CD_IVA	Always enabled	CM_L3MAIN2_DYNAMICDEP[2] IVAHD_DYNDEP	Read only
CD_L3_MAIN1	Always enabled	CM_L3MAIN2_DYNAMICDEP[5] L3_MAIN1_DYNDEP	Read only
CD_L4_PER	Always enabled	CM_L3MAIN2_DYNAMICDEP[13] L4PER_DYNDEP	Read only
CD_L4_SEC	Always enabled	CM_L3MAIN2_DYNAMICDEP[14] L4SEC_DYNDEP	Read only

3.6.17.4 Clock Domain Module Attributes

Table 3-184 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-184. CD_L3_MAIN2 Modules Clocks Association

Module	Clock	Clock Type
GPMC	L3MAIN2_L3_GICLK	Interface
L3_MAIN2 interconnect	L3MAIN2_L3_GICLK	Interface
	L3MAIN2_L4_GICLK	Interface
OCMC_RAM	L3MAIN2_L3_GICLK	Interface

Table 3-185 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-185. CD_L3_MAIN2 Modules Wake-Up Request

Module	Wake-Up Feature
GPMC	None
L3_MAIN2 interconnect	None
OCMC_RAM	None

Table 3-186 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-186. CD_L3_MAIN2 Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
GPMC	Slave	CM_L3MAIN2_GPMC_CLKCTRL[17:16] IDLEST	Idle status
L3_MAIN2 interconnect	Slave	CM_L3MAIN2_L3_MAIN_2_CLKCTRL[17:16] IDLEST	Idle status
OCMC_RAM	Slave	CM_L3MAIN2_OCMC_RAM_CLKCTRL[17:16] IDLEST	Idle status

Table 3-187 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-187. CD_L3_MAIN2 Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
GPMC	Available	Available	N/A	CM_L3MAIN2_GPMC_CLKCTRL[1:0] MODULEMODE	Read/write

OCMC_RAM	N/A	Available	N/A	CM_L3MAIN2_OCMC_RAM_CLKCTRL[1:0] MODULEMODE	Read only

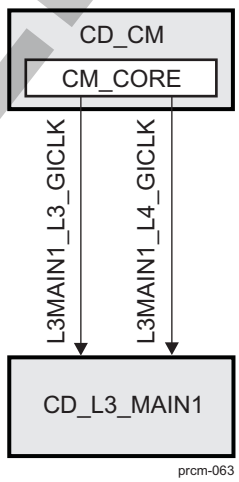
3.6.18 CD_L3_MAIN1 Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.18.1 Overview

Figure 3-70 is an overview of the clock domain.

Figure 3-70. CD_L3_MAIN1 Overview



3.6.18.2 Clock Domain Modes

Table 3-188 lists the clock domain modes supported by the clock domain.

Table 3-188. CD_L3_MAIN1 Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Not available	Available

Table 3-189 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-189. CD_L3_MAIN1 Control and Status Parameters

Parameter Name	Control/Status Bit Field
L3MAIN1_L3_GICLK Clock Status	CM_L3MAIN1_CLKSTCTRL[8] CLKACTIVITY_L3MAIN1_L3_GICLK
Clock Domain State Transition Control	CM_L3MAIN1_CLKSTCTRL[1:0] CLKTRCTRL

3.6.18.3 Clock Domain Dependency

CD_L3_MAIN1 has no static or module wake-up dependency with any other clock domain of the device.

3.6.18.3.1 Dynamic Dependency

Table 3-190 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-190. CD_L3_MAIN1 Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Always enabled	CM_L3MAIN1_DYNAMICDEP[3] ABE_DYNDEP	Read only
CD_L3_MAIN2	Always enabled	CM_L3MAIN1_DYNAMICDEP[6] L3MAIN2_DYNDEP	Read only
CD_L4_CFG	Always enabled	CM_L3MAIN1_DYNAMICDEP[12] L4CFG_DYNDEP	Read only
CD_EMIF	Always enabled	CM_L3MAIN1_DYNAMICDEP[4] EMIF_DYNDEP	Read only
CD_WKUPAON	Always enabled	CM_L3MAIN1_DYNAMICDEP[15] WKUPAON_DYNDEP	Read only

3.6.18.4 Clock Domain Module Attributes

Table 3-191 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-191. CD_L3_MAIN1 Modules Clocks Association

Module	Clock	Clock Type
L3_MAIN1 interconnect	L3MAIN1_L3_GICLK	Interface
	L3MAIN1_L4_GICLK	Interface

Table 3-192 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-192. CD_L3_MAIN1 Modules Wake-Up Request

Module	Wake-Up Feature
L3_MAIN1 interconnect	None

Table 3-193 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-193. CD_L3_MAIN1 Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
L3_MAIN1 interconnect	Slave	CM_L3MAIN1_L3_MAIN_1_CLKCTRL[17:16] IDLEST	Idle status

Table 3-194 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-194. CD_L3_MAIN1 Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
L3_MAIN1 interconnect	N/A	Available	N/A	CM_L3MAIN1_L3_MAIN_1_CLKCTRL[1:0] MODULEMODE	Read only

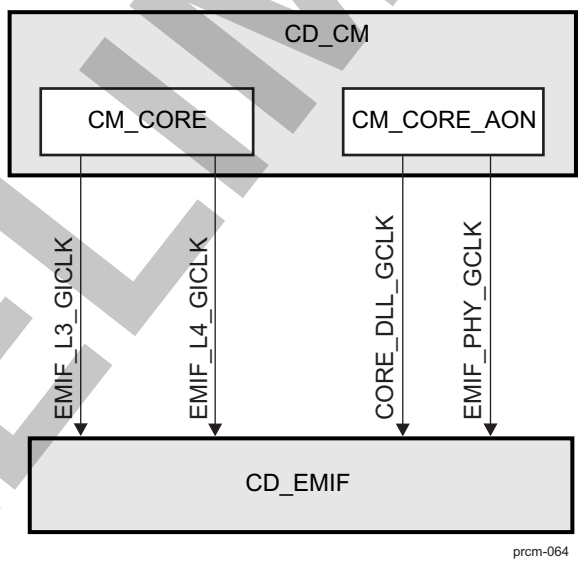
3.6.19 CD_EMIF Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.19.1 Overview

Figure 3-71 is an overview of the clock domain.

Figure 3-71. CD_EMIF Overview



3.6.19.2 Clock Domain Modes

Table 3-195 lists the clock domain modes supported by the clock domain.

Table 3-195. CD_EMIF Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Available	Available

Table 3-196 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-196. CD_EMIF Control and Status Parameters

Parameter Name	Control/Status Bit Field
CORE_DLL_GCLK Clock Status	CM_EMIF_CLKSTCTRL[9] CLKACTIVITY_DLL_GCLK
CORE_DLL_GCLK Clock Control	CM_EMIF_EMIF_DLL_CLKCTRL[8] OPTFCLKEN_DLL_CLK
EMIF_L3_GICLK Clock Status	CM_EMIF_CLKSTCTRL[8] CLKACTIVITY_EMIF_L3_GICLK
EMIF_PHY_GCLK Clock Status	CM_EMIF_CLKSTCTRL[10] CLKACTIVITY_EMIF_PHY_GCLK
Clock Domain State Transition Control	CM_EMIF_CLKSTCTRL[1:0] CLKTRCTRL

3.6.19.3 Clock Domain Dependency

CD_EMIF has no static, dynamic, or module wake-up dependency with any other clock domain of the device.

3.6.19.4 Clock Domain Module Attributes

Table 3-197 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-197. CD_EMIF Modules Clocks Association

Module	Clock	Clock Type
DLL	CORE_DLL_GCLK	Functional
DMM	EMIF_L3_GICLK	Interface
DDRPHY	EMIF_PHY_GCLK	Interface
EMIF1	CORE_DLL_GCLK	Interface
	EMIF_L3_GICLK	Interface
	MA_EOCP_GICLK(1)	Interface
	L3_EOCP_GICLK(1)	Interface
	EMIF_PHY_GCLK	Interface
EMIF2	CORE_DLL_GCLK	Interface
	EMIF_L3_GICLK	Interface
	MA_EOCP_GICLK(1)	Interface
	L3_EOCP_GICLK(1)	Interface
	EMIF_PHY_GCLK	Interface
EMIF_OCP_FW	EMIF_L3_GICLK	Interface
	EMIF_L4_GICLK	Interface

(1) EMIF modules are clocked by MA_EOCP_GICLK when MPU is active; otherwise, the L3_EOCP_GICLK clock is used.

Table 3-198 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-198. CD_EMIF Modules Wake-Up Request

Module	Wake-Up Feature
DDRPHY	None
DLL	None
DMM	None
EMIF1	None
EMIF2	None
EMIF_OCP_FW	None

Table 3-199 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-199. CD_EMIF Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
DMM	Slave	CM_EMIF_DMM_CLKCTRL[17:16] IDLEST	Idle status
EMIF1	Slave	CM_EMIF_EMIF1_CLKCTRL[17:16] IDLEST	Idle status
EMIF2	Slave	CM_EMIF_EMIF2_CLKCTRL[17:16] IDLEST	Idle status
EMIF_OCP_FW	Slave	CM_EMIF_EMIF_OCP_FW_CLKCTRL[17:16] IDLEST	Idle status

Table 3-200 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-200. CD_EMIF Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
DMM	N/A	Available	N/A	CM_EMIF_DMM_CLKCTRL[1:0] MODULEMODE	Read only
EMIF1	Available	Available	N/A	CM_EMIF_EMIF1_CLKCTRL[1:0] MODULEMODE	Read/write
EMIF2	Available	Available	N/A	CM_EMIF_EMIF2_CLKCTRL[1:0] MODULEMODE	Read/write
EMIF_OCP_FW	N/A	Available	N/A	CM_EMIF_EMIF_OCP_FW_CLKCTRL[1:0] MODULEMODE	Read only

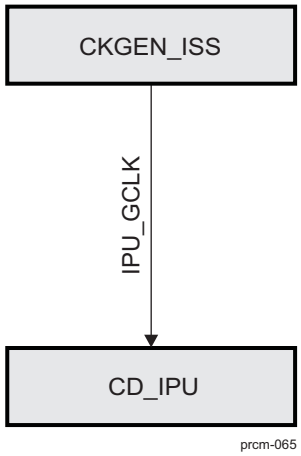
3.6.20 CD_IPU Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.20.1 Overview

Figure 3-72 is an overview of the clock domain.

Figure 3-72. CD_IPU Overview



3.6.20.2 Clock Domain Modes

Table 3-201 lists the clock domain modes supported by the clock domain.

Table 3-201. CD_IPU Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-202 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-202. CD_IPU Control and Status Parameters

Parameter Name	Control/Status Bit Field
IPU_GCLK Clock Status	CM_IPU_CLKSTCTRL[8] CLKACTIVITY_IPU_GCLK
Clock Domain State Transition Control	CM_IPU_CLKSTCTRL[1:0] CLKTRCTRL

3.6.20.3 Clock Domain Dependency

CD_IPU has no module wake-up dependency with any other clock domain of the device.

3.6.20.3.1 Static Dependency

Table 3-203 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-203. CD_IPU Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Disabled	CM_IPU_STATICDEP[3] ABE_STATDEP	Read/write
CD_DSS	Disabled	CM_IPU_STATICDEP[8] DSS_STATDEP	Read/write
CD_GPU	Disabled	CM_IPU_STATICDEP[10] GPU_STATDEP	Read/write
CD_CAM	Always disabled	CM_IPU_STATICDEP[9] CAM_STATDEP	Read only
CD_IVA	Disabled	CM_IPU_STATICDEP[2] IVA_STATDEP	Read/write
CD_L3_MAIN1	Enabled	CM_IPU_STATICDEP[5] L3MAIN1_STATDEP	Read/write
CD_L3_MAIN2	Enabled	CM_IPU_STATICDEP[6] L3MAIN2_STATDEP	Read/write
CD_L3INIT	Disabled	CM_IPU_STATICDEP[7] L3INIT_STATDEP	Read/write
CD_L4_CFG	Enabled	CM_IPU_STATICDEP[12] L4CFG_STATDEP	Read/write
CD_L4_PER	Disabled	CM_IPU_STATICDEP[13] L4PER_STATDEP	Read/write
CD_L4_SEC	Disabled	CM_IPU_STATICDEP[14] L4SEC_STATDEP	Read/write
CD_EMIF	Enabled	CM_IPU_STATICDEP[4] EMIF_STATDEP	Read/write
CD_DMA	Always disabled	CM_IPU_STATICDEP[11] SDMA_STATDEP	Read only
CD_DSP	Disabled	CM_IPU_STATICDEP[1] DSP_STATDEP	Read/write
CD_WKUPAON	Enabled	CM_IPU_STATICDEP[15] WKUPAON_STATDEP	Read/write

Table 3-203. CD_IPU Static Dependency Association Parameters (continued)

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_COREAON	Always disabled	CM_IPU_STATICDEP[16] COREAON_STATDEP	Read only
CD_CUSTEFUSE	Always disabled	CM_IPU_STATICDEP[17] CUSTEFUSE_STATDEP	Read only

3.6.20.3.2 Dynamic Dependency

Table 3-204 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-204. CD_IPU Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_CAM	Alway disabled	CM_IPU_DYNAMICDEP[9] CAM_DYNDEP	Read only
CD_L3_MAIN2	Always enabled	CM_IPU_DYNAMICDEP[6] L3MAIN2_DYNDEP	Read only

3.6.20.4 Clock Domain Module Attributes

Table 3-205 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-205. CD_IPU Modules Clocks Association

Module	Clock	Clock Type
IPU	IPU_GCLK	Interface and functional

Table 3-206 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-206. CD_IPU Modules Wake-Up Request

Module	Wake-Up Feature
IPU	Master wake-up request

Table 3-207 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-207. CD_IPU Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
IPU	Master/slave	CM_IPU_IPU_CLKCTRL[18] STBYST	Standby status
		CM_IPU_IPU_CLKCTRL[17:16] IDLEST	Idle status

Table 3-208 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-208. CD_IPU Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
IPU	Available	Available	N/A	CM_IPU_IPU_CLKCTRL[1:0] MODULEMODE	Read/write

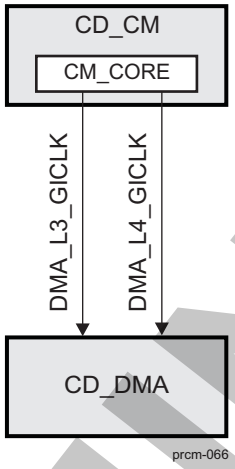
3.6.21 CD_DMA Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.21.1 Overview

Figure 3-73 is an overview of the clock domain.

Figure 3-73. CD_DMA Overview



3.6.21.2 Clock Domain Modes

Table 3-209 lists the clock domain modes supported by the clock domain.

Table 3-209. CD_DMA Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Available	Available

Table 3-210 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-210. CD_DMA Control and Status Parameters

Parameter Name	Control/Status Bit Field
DMA_L3_GICLK Clock Status	CM_DMA_CLKSTCTRL[8] CLKACTIVITY_DMA_L3_GICLK
Clock Domain State Transition Control	CM_DMA_CLKSTCTRL[1:0] CLKTRCTRL

3.6.21.3 Clock Domain Dependency

CD_DMA has no module wake-up dependency with any other clock domain of the device.

3.6.21.3.1 Static Dependency

Table 3-211 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-211. CD_DMA Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Disabled	CM_DMA_STATICDEP[3] ABE_STATDEP	Read/write
CD_DSS	Disabled	CM_DMA_STATICDEP[8] DSS_STATDEP	Read/write

Table 3-211. CD_DMA Static Dependency Association Parameters (continued)

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_CAM	Alway disabled	CM_DMA_STATICDEP[9] CAM_STATDEP	Read only
CD_IVA	Disabled	CM_DMA_STATICDEP[2] IVA_STATDEP	Read/write
CD_L3_MAIN1	Enabled	CM_DMA_STATICDEP[5] L3MAIN1_STATDEP	Read/write
CD_L3_MAIN2	Enabled	CM_DMA_STATICDEP[6] L3MAIN2_STATDEP	Read only
CD_L3INIT	Enabled	CM_DMA_STATICDEP[7] L3INIT_STATDEP	Read/write
CD_L4_CFG	Enabled	CM_DMA_STATICDEP[12] L4CFG_STATDEP	Read/write
CD_L4_PER	Enabled	CM_DMA_STATICDEP[13] L4PER_STATDEP	Read/write
CD_EMIF	Enabled	CM_IPU_STATICDEP[4] EMIF_STATDEP	Read/write
CD_WKUPAON	Enabled	CM_DMA_STATICDEP[15] WKUPAON_STATDEP	Read/write
CD_IPU	Disabled	CM_DMA_STATICDEP[0] IPU_STATDEP	Read/write

3.6.21.3.2 Dynamic Dependency

Table 3-212 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-212. CD_DMA Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN2	Always disabled	CM_DMA_DYNAMICDEP[6] L3MAIN2_DYNDEP	Read only

3.6.21.4 Clock Domain Module Attributes

Table 3-213 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-213. CD_DMA Modules Clocks Association

Module	Clock	Clock Type
DMA_SYSTEM	DMA_L3_GICLK	Interface and functional
	DMA_L4_GICLK	Interface

Table 3-214 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-214. CD_DMA Modules Wake-Up Request

Module	Wake-Up Feature
DMA_SYSTEM	Master wake-up request

Table 3-215 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-215. CD_DMA Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
DMA_SYSTEM	Master/slave	CM_DMA_DMA_SYSTEM_CLKCTRL[18] STBYST	Standby status
		CM_DMA_DMA_SYSTEM_CLKCTRL[17:16] IDLEST	Idle status

Table 3-216 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-216. CD_DMA Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
DMA_SYSTEM	N/A	Available	N/A	CM_DMA_DMA_SYSTEM_CLKCTRL[1:0] MODULEMODE	Read only

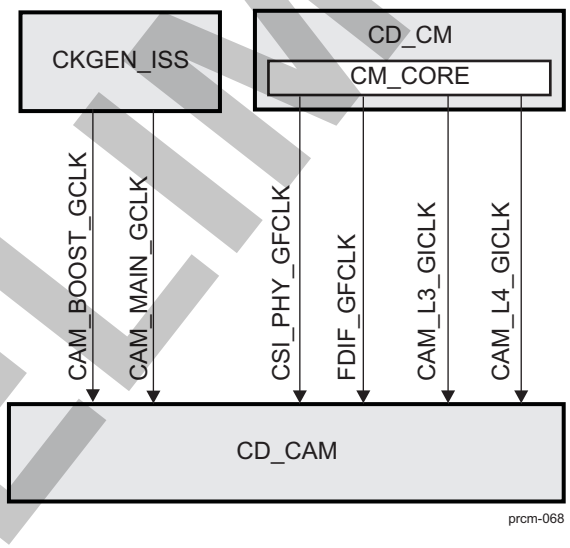
3.6.22 CD_CAM Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.22.1 Overview

Figure 3-74 is an overview of the clock domain.

Figure 3-74. CD_CAM Overview



The CKGEN_ISS (clock generator) is not part of the PRCM module. It is in the ISS.

3.6.22.2 Clock Domain Modes

Table 3-217 lists the clock domain modes supported by the clock domain.

Table 3-217. CD_CAM Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-218 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-218. CD_CAM Control and Status Parameters

Parameter Name	Control/Status Bit Field
CSI_PHY_GFCLK Clock Status	CM_CAM_CLKSTCTRL[9] CLKACTIVITY_CSI_PHY_GFCLK
CSI_PHY_GFCLK Clock Control	CM_CAM_ISS_CLKCTRL[8] OPTFCLKEN_CTRLCLK
FDIF_GFCLK Clock Status	CM_CAM_CLKSTCTRL[10] CLKACTIVITY_FDIF_GCLK
FDIF_GFCLK Clock Control	CM_CAM_FDIF_CLKCTRL[24] CLKSEL_FCLK
CAM_MAIN_GCLK Clock Status	CM_CAM_CLKSTCTRL[8] CLKACTIVITY_CAM_GCLK
CAM_L3_GICLK Clock Status	CM_CAM_CLKSTCTRL[12] CLKACTIVITY_CAM_L3_GICLK
CAM_BOOST_GCLK Clock Status	CM_CAM_CLKSTCTRL[11] CLKACTIVITY_CAM_BOOST_GCLK
Clock Domain State Transition Control	CM_CAM_CLKSTCTRL[1:0] CLKTRCTRL

3.6.22.3 Clock Domain Dependency

CD_CAM has no module wake-up dependency with any other clock domain of the device.

3.6.22.3.1 Static Dependency

Table 3-219 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-219. CD_CAM Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_IVA	Disabled	CM_CAM_STATICDEP[2] IVA_STATDEP	Read/write
CD_L3_MAIN1	Disabled	CM_CAM_STATICDEP[5] L3MAIN1_STATDEP	Read/write
CD_L3_MAIN2	Always enabled	CM_CAM_STATICDEP[6] L3MAIN2_STATDEP	Read only
CD_EMIF	Disabled	CM_CAM_STATICDEP[4] EMIF_STATDEP	Read/write

3.6.22.3.2 Dynamic Dependency

Table 3-220 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-220. CD_CAM Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN2	Alway disabled	CM_CAM_DYNAMICDEP[6] L3MAIN2_DYNDEP	Read only

3.6.22.4 Clock Domain Module Attributes

Table 3-221 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-221. CD_CAM Modules Clocks Association

Module	Clock	Clock Type
FDIF	FDIF_GCLK	Interface and functional
ISS	CAM_BOOST_GCLK	Functional

Table 3-221. CD_CAM Modules Clocks Association (continued)

Module	Clock	Clock Type
	CSI_PHY_GFCLK	Functional
	CAM_MAIN_GCLK	Interface

Table 3-222 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-222. CD_CAM Modules Wake-Up Request

Module	Wake-Up Feature
FDIF	None
ISS	None

Table 3-223 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-223. CD_CAM Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
FDIF	Master/slave	CM_CAM_FDIF_CLKCTRL[18] STBYST	Standby status
		CM_CAM_FDIF_CLKCTRL[17:16] IDLEST	Idle status
ISS	Master/slave	CM_CAM_ISS_CLKCTRL[18] STBYST	Standby status
		CM_CAM_ISS_CLKCTRL[17:16] IDLEST	Idle status

Table 3-224 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-224. CD_CAM Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
FDIF	Available	N/A	Available	CM_CAM_FDIF_CLKCTRL[1:0] MODULEMODE	Read/write
ISS	Available	N/A	Available	CM_CAM_ISS_CLKCTRL[1:0] MODULEMODE	Read/write

NOTE: In order to enable and access ISS module, first the IPU module must be enabled and the reset for CACHE_IPU and CACHE_MMU_IPU must be cleared.

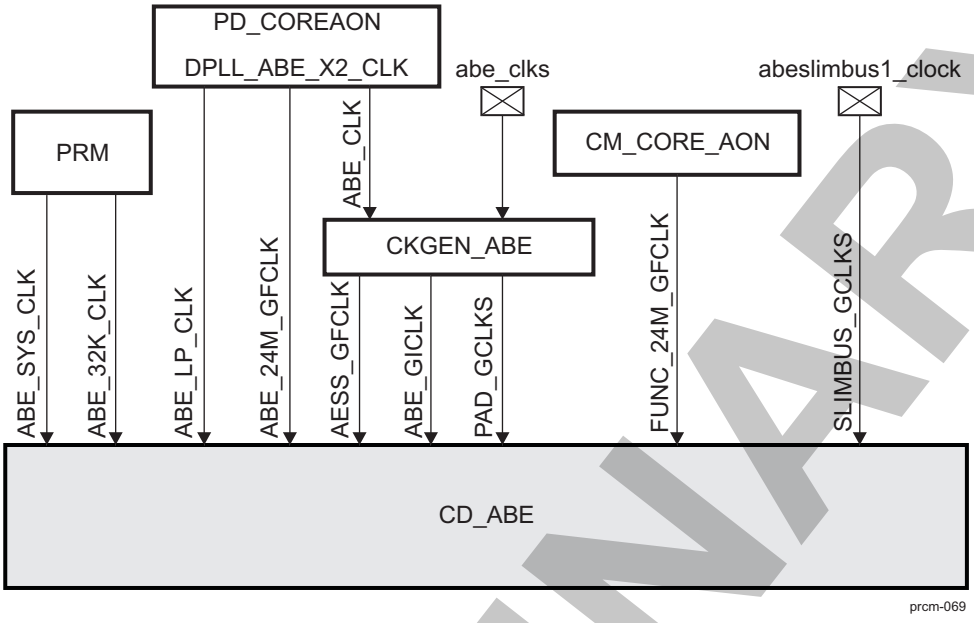
3.6.23 CD_ABE Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.23.1 Overview

Figure 3-75 is an overview of the clock domain.

Figure 3-75. CD_ABE Overview



3.6.23.2 Clock Domain Modes

Table 3-225 lists the clock domain modes supported by the clock domain.

Table 3-225. CD_ABE Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-226 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-226. CD_ABE Control and Status Parameters

Parameter Name	Control/Status Bit Field
ABE_24M_GFCLK Clock Status	CM_ABE_CLKSTCTRL[13] CLKACTIVITY_ABE_24M_GFCLK
ABE_32K_CLK Clock Status	CM_ABE_CLKSTCTRL[12] CLKACTIVITY_ABE_32K_CLK
ABE_SYS_CLK Clock Status	CM_ABE_CLKSTCTRL[11] CLKACTIVITY_ABE_SYS_CLK
DPLL_ABE_X2_CLK Clock Status	CM_ABE_CLKSTCTRL[8] CLKACTIVITY_ABE_X2_CLK
FUNC_24M_GFCLK Clock Status	CM_ABE_CLKSTCTRL[10] CLKACTIVITY_FUNC_24M_GFCLK
ABE_GICLK Clock Status	CM_ABE_CLKSTCTRL[9] CLKACTIVITY_ABE_GICLK
AESS_GFCLK Clock Control	CM_ABE_AESS_CLKCTRL[24] CLKSEL_AESS_GFCLK
Clock Domain State Transition Control	CM_ABE_CLKSTCTRL[1:0] CLKTRCTRL

3.6.23.3 Clock Domain Dependency

CD_ABE has no static or dynamic dependency with any other clock domain of the device.

3.6.23.3.1 Wake-Up Dependency

Table 3-227 lists the wake-up dependency settings for the modules of this clock in the clock domain

Table 3-227. CD_ABE Wake-Up Dependency Association Parameters

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
DMIC	CD_ABE	CD_DMA, CD_L3_MAIN1, CD_L3_MAIN2	Disabled	PM_ABE_DMIC_WKDEP[7] WKUPDEP_DMIC_DMA_SDMA	Read/write
DMIC	CD_ABE	CD_DSP	Disabled	PM_ABE_DMIC_WKDEP[6] WKUPDEP_DMIC_DMA_DSP	Read/write
DMIC	CD_ABE	CD_DSP	Disabled	PM_ABE_DMIC_WKDEP[2] WKUPDEP_DMIC_IRQ_DSP	Read/write

3.6.23.4 Clock Domain Module Attributes

Table 3-228 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-228. CD_ABE Modules Clocks Association

Module	Clock	Clock Type
AESS	AESS_GFCLK	Functional
	ABE_GICLK	Interface
DMIC	DMIC_GFCLK	Functional
	ABE_GICLK	Interface
L4_ABE interconnect	ABE_GICLK	Interface
MCASP	MCASP_GFCLK	Functional
	ABE_GICLK	Interface and functional
MCBSP1	MCBSP1_GFCLK	Functional
	ABE_GICLK	Interface
MCBSP2	MCBSP2_GFCLK	Functional
	ABE_GICLK	Interface
MCBSP3	MCBSP3_GFCLK	Functional
	ABE_GICLK	Interface
MCPDM	ABE_GICLK	Interface
	PAD_GCLKS	Functional
TIMER5	TIMER5_GFCLK	Functional
	ABE_GICLK	Interface
TIMER6	TIMER6_GFCLK	Functional
	ABE_GICLK	Interface
TIMER7	TIMER7_GFCLK	Functional
	ABE_GICLK	Interface
TIMER8	TIMER8_GFCLK	Functional
	ABE_GICLK	Interface
WD_TIMER3	ABE_32K_CLK	Functional
	ABE_GICLK	Interface

Table 3-229 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-229. CD_ABE Modules Wake-Up Request

Module	Wake-Up Feature
AESS	None
DMIC	Slave wake-up request (MPU-IRQ, DSP-IRQ and DMA, DMA_SYSTEM-DMA)
L4_ABE interconnect	None
MCASP	Slave wake-up request (MPU-IRQ, DSP-IRQ and DMA, DMA_SYSTEM-DMA)
MCBSP1	Slave wake-up request (MPU-IRQ, DSP-IRQ and DMA, DMA_SYSTEM-DMA)
MCBSP2	Slave wake-up request (MPU-IRQ, DSP-IRQ and DMA, DMA_SYSTEM-DMA)
MCBSP3	Slave wake-up request (MPU-IRQ, DSP-IRQ and DMA, DMA_SYSTEM-DMA)
MCPDM	Slave wake-up request (MPU-IRQ, DSP-IRQ and DMA, DMA_SYSTEM-DMA)
TIMER5	Slave wake-up request (MPU-IRQ, DSP-IRQ)

Table 3-229. CD_ABE Modules Wake-Up Request (continued)

Module	Wake-Up Feature
TIMER6	Slave wake-up request (MPU-IRQ, DSP-IRQ)
TIMER7	Slave wake-up request (MPU-IRQ, DSP-IRQ)
TIMER8	Slave wake-up request (MPU-IRQ, DSP-IRQ)
WD_TIMER3	Slave wake-up request (MPU-IRQ)

Table 3-230 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-230. CD_ABE Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
AESS	Slave/master	CM_ABE_AESS_CLKCTRL[18] STBYST	Standby status
		CM_ABE_AESS_CLKCTRL[17:16] IDLEST	Idle status
DMIC	Slave	CM_ABE_DMIC_CLKCTRL[17:16] IDLEST	Idle status
L4_ABE interconnect	Slave	CM_ABE_L4_ABE_CLKCTRL[17:16] IDLEST	Idle status
MCASP	Slave	CM_ABE_MCASP_CLKCTRL[17:16] IDLEST	Idle status
MCBSP1	Slave	CM_ABE_MCBSP1_CLKCTRL[17:16] IDLEST	Idle status
MCBSP2	Slave	CM_ABE_MCBSP2_CLKCTRL[17:16] IDLEST	Idle status
MCBSP3	Slave	CM_ABE_MCBSP3_CLKCTRL[17:16] IDLEST	Idle status
MCPDM	Slave	CM_ABE_MCPDM_CLKCTRL[17:16] IDLEST	Idle status
TIMER5	Slave	CM_ABE_TIMER5_CLKCTRL[17:16] IDLEST	Idle status

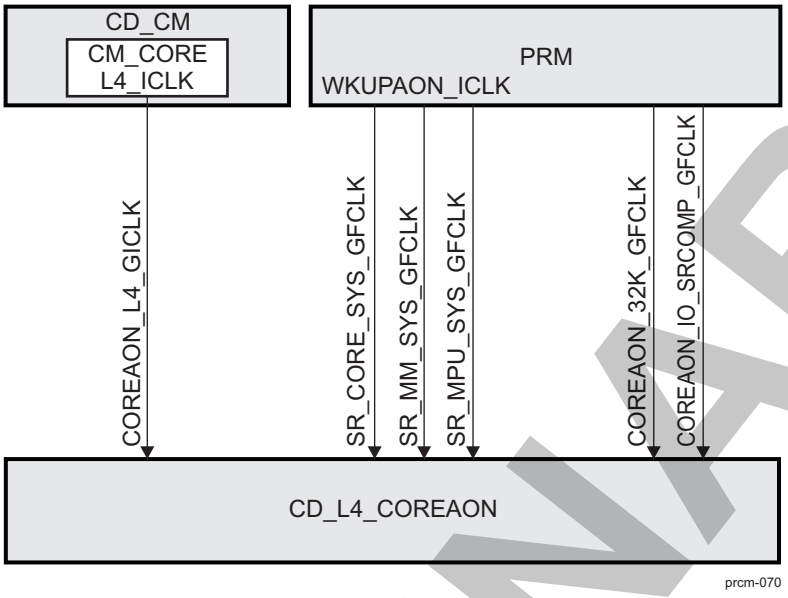
3.6.24 CD_COREAON_L4 Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.24.1 CD_COREAON_L4 Overview

Figure 3-76 is an overview of the clock domain.

Figure 3-76. CD_COREAON_L4 Overview



3.6.24.2 Clock Domain Modes

Table 3-232 lists the clock domain modes supported by the clock domain.

Table 3-232. CD_COREAON_L4 Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	N/A	Available	Available

Table 3-233 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-233. CD_COREAON_L4 Control and Status Parameters

Parameter Name	Control/Status Bit Field
COREAON_32K_GFCLK Clock Status	CM_COREAON_CLKSTCTRL[12] CLKACTIVITY_COREAON_32K_GFCLK
COREAON_32K_GFCLK Clock Control	CM_COREAON_USB_PHY_CORE_CLKCTRL[8] OPTFCLKEN_CLK32K
SR_CORE_SYS_GFCLK Clock Status	CM_COREAON_CLKSTCTRL[11] CLKACTIVITY_SR_CORE_SYS_GFCLK
SR_MM_SYS_GFCLK Clock Status	CM_COREAON_CLKSTCTRL[10] CLKACTIVITY_SR_MM_SYS_GFCLK
SR_MPU_SYS_GFCLK Clock Status	CM_COREAON_CLKSTCTRL[9] CLKACTIVITY_SR_MPU_SYS_GFCLK
COREAON_L4_GICLK Clock Status	CM_COREAON_CLKSTCTRL[8] CLKACTIVITY_COREAON_L4_GICLK
COREAON_IO_SRCOMP_GFCLK Clock Status	CM_COREAON_CLKSTCTRL[14] CLKACTIVITY_COREAON_IO_SRCOMP_GFCLK
COREAON_IO_SRCOMP_GFCLK Clock Control	CM_COREAON_IO_SRCOMP_CLKCTRL[8] CLKEN_SRCOMP_FCLK
Clock Domain State Transition Control	CM_COREAON_CLKSTCTRL[1:0] CLKTRCTRL

3.6.24.3 Clock Domain Dependency

CD_COREAON_L4 has no static or dynamic dependency with any other clock domain of the device.

3.6.24.3.1 Wake-Up Dependency

Table 3-234 lists the wake-up dependency settings for the modules of this clock domain.

Table 3-234. CD_COREAON_L4 Wake-Up Dependency Association Parameters

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
SMARTREFLEX_CORE	CD_COREAON_L4	CD_IPU, CD_L3_MAIN2, CD_L3_MAIN1, CD_L4_CFG	Disabled	PM_COREAON_SMARTREFLEX_CORE_WKDEP[1] WKUPDEP_SMARTREFLEX_CORE_IPU	Read/write
	CD_COREAON_L4	CD_MPU, CD_L3_MAIN1, CD_L4_CFG	Disabled	PM_COREAON_SMARTREFLEX_CORE_WKDEP[0] WKUPDEP_SMARTREFLEX_CORE_MPU	Read/write
SMARTREFLEX_MM	CD_COREAON_L4	CD_MPU, CD_L3_MAIN1, CD_L4_CFG	Disabled	PM_COREAON_SMARTREFLEX_MM_WKDEP[0] WKUPDEP_SMARTREFLEX_MM_MPU	Read/write
SMARTREFLEX_MPU	CD_COREAON_L4	CD_MPU, CD_L3_MAIN1, CD_L4_CFG	Enabled	PM_COREAON_SMARTREFLEX_MPU_WKDEP[0] WKUPDEP_SMARTREFLEX_MPU_MPU	Read/write

3.6.24.4 Clock Domain Module Attributes

Table 3-235 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-235. CD_COREAON_L4 Modules Clocks Association

Module	Clock	Clock Type
SMARTREFLEX_CORE	COREAON_L4_GICLK	Interface
	SR_CORE_SYS_GFCLK	Functional
SMARTREFLEX_MM	COREAON_L4_GICLK	Interface
	SR_MM_SYS_GFCLK	Functional
SMARTREFLEX_MPU	COREAON_L4_GICLK	Interface
	SR_MPU_SYS_GFCLK	Functional
USB_PHY_CORE	COREAON_32K_GFCLK	Functional
IO_SRCOMP_CORE	COREAON_IO_SRCOMP_GFCLK	Functional

Table 3-236 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-236. CD_COREAON_L4 Modules Wake-Up Request

Module	Wake-Up Feature
SMARTREFLEX_CORE	Slave wake-up request (MPU-IRQ, IPU-IRQ)
SMARTREFLEX_MM	Slave wake-up request (MPU-IRQ)

Table 3-236. CD_COREAON_L4 Modules Wake-Up Request (continued)

Module	Wake-Up Feature
SMARTREFLEX_MPU	Slave wake-up request (MPU-IRQ)
USB_PHY_CORE	None
IO_SRCOMP_CORE	None

Table 3-237 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-237. CD_COREAON_L4 Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
SMARTREFLEX_CORE	Slave	CM_COREAON_SMARTREFLEX_CORE_CLKCTRL[17:16] IDLEST	Idle status
SMARTREFLEX_MM	Slave	CM_COREAON_SMARTREFLEX_MM_CLKCTRL[17:16] IDLEST	Idle status
SMARTREFLEX_MPU	Slave	CM_COREAON_SMARTREFLEX_MPU_CLKCTRL[17:16] IDLEST	Idle status

Table 3-238 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-238. CD_COREAON_L4 Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
SMARTREFLEX_CORE	Available	N/A	Available	CM_COREAON_SMARTREFLEX_CORE_CLKCTRL[1:0] MODULEMODE	Read/write
SMARTREFLEX_MM	Available	N/A	Available	CM_COREAON_SMARTREFLEX_MM_CLKCTRL[1:0] MODULEMODE	Read/write
SMARTREFLEX_MPU	Available	N/A	Available	CM_COREAON_SMARTREFLEX_MPU_CLKCTRL[1:0] MODULEMODE	Read/write

3.7 Power Management Functional Description

This section describes the functional concepts of power management at the power domain level in the device.

The following power domains support dynamic power switching (DPS) with switching times of less than 5 µs.

- PD_CORE
- PD_DSP
- PD_MPU

For these three power domains, the "SWITCH_LOOPBACK" parameter of corresponding PSCON must be chosen correctly in order to allow loop-back of PONOUT to PGOODIN.

For other power domains, the "SWITCH_LOOPBACK" parameter will be chosen in the other way. A 10µs delay will be included by PSCON between PONIN and PGOODIN.

3.7.1 PD_WKUPAON Description

PD_WKUPAON contains the following reset domains:

- WKUPAON_PWRON_RST
- WKUPAON_RST
- WKUPAON_SYS_PWRON_RST
- PRM_PWRON_RST
- PRM_RST
- LPRM_PWRON_RST
- LPRM_RST

PD_WKUPAON contains the CD_WKUPAON clock domain.

Table 3-239 lists the logic retention capability for each module of the power domain.

Table 3-239. PD_WKUPAON Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
CTRL_MODULE_WKUP	No	None	None
GPIO1	No	RM_WKUPAON_GPIO1_CONTEXT[0] LOSTCONTEXT_DFF	None
KBD	No	RM_WKUPAON_KBD_CONTEXT[0] LOSTCONTEXT_DFF	None
PRCM_MPU	No	None	None
SAR_RAM	No	RM_WKUPAON_SAR_RAM_CONTEXT[0] LOSTCONTEXT_DFF	None
SCRM	No	None	None
COUNTER_32K	No	RM_WKUPAON_COUNTER_32K_CONTEXT[0] LOSTCONTEXT_DFF	None
TIMER1	No	RM_WKUPAON_TIMER1_CONTEXT[0] LOSTCONTEXT_DFF	None
WD_TIMER2	No	RM_WKUPAON_WD_TIMER2_CONTEXT[0] LOSTCONTEXT_DFF	None
L4_WKUP interconnect	No	RM_WKUPAON_L4_WKUP_CONTEXT[0] LOSTCONTEXT_DFF	None
PRM	No	None	None
IO_SRCOMP_WKUP	No	None	None

3.7.1.1 Power Domain Modes

The PD_WKUPAON power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power state control or status bit field for this power domain.

The PD_WKUPAON power domain has one memory bank, sar_bank, which is related to SAR_RAM.

3.7.1.1.1 Logic and Memory Area Power Modes

Table 3-240 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention columns in the table identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-240. PD_WKUPAON Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
WKUP_BANK		ON		

3.7.2 PD_DSP Description

PD_DSP contains the following reset domains:

- DSP_RST
- DSP_PWRON_RST
- DSP_RET_RST
- DSP_SYS_RST

PD_DSP contains the CD_DSP clock domain.

Table 3-241 lists the logic retention capability for each module of the power domain.

Table 3-241. PD_DSP Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DSP	Partial	RM_DSP_DSP_CONTEXT[0] LOSTCONTEXT_DFF	RM_DSP_DSP_CONTEXT[1] LOSTCONTEXT_RFF

3.7.2.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.2.1.1 Logic and Memory Area Power Modes

Table 3-242 lists the power modes supported by the logic area of the power domain.

Table 3-242. PD_DSP Logic Area Power Modes

Retention-CSWR	On-Inactive	On-Active
Available	Available	Available

Table 3-243 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On and Logic Retention columns in the table identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-243. PD_DSP Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention
DSP_DMA		ON	RETENTION
	DSP – DSP_DMA	always_on	always_retention
DSP_L1		ON	RETENTION
	DSP – DSP_L1	always_on	software_control
DSP_L2		ON	RETENTION
	DSP – DSP_L2	always_on	software_control

3.7.2.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-244 lists the power mode controls for the power domain.

Table 3-244. PD_DSP Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (logic in RETENTION state)	DSP_L2	PM_DSP_PWRSTCTRL[9] DSP_L2_RETSTATE	Read/write
Memory Area – State Control (logic in RETENTION state)	DSP_L1	PM_DSP_PWRSTCTRL[8] DSP_L1_RETSTATE	Read/write
Power Domain – Low-Power State Change Control		PM_DSP_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Memory Area – State Control (logic in ON state)	DSP_DMA	PM_DSP_PWRSTCTRL[21:20] DSP_EDMA_ONSTATE	Read only
Logic Area – Retention State Control		PM_DSP_PWRSTCTRL[2] LOGICRETSTATE	Read/write
Memory Area – State Control (logic in ON state)	DSP_L2	PM_DSP_PWRSTCTRL[19:18] DSP_L2_ONSTATE	Read only
Memory Area – State Control (logic in ON state)	DSP_L1	PM_DSP_PWRSTCTRL[17:16] DSP_L1_ONSTATE	Read only
Memory Area – State Control (logic in RETENTION state)	DSP_EDMA	PM_DSP_PWRSTCTRL[10] DSP_EDMA_RETSTATE	Read only
Power Domain – State Transition Control		PM_DSP_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-245 lists the power mode status for the power domain.

Table 3-245. PD_DSP Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain – Last Power State Entered Status		PM_DSP_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area – State Status	DSP_EDMA	PM_DSP_PWRSTST[9:8] DSP_EDMA_STATEST
Memory Area – State Status	DSP_L2	PM_DSP_PWRSTST[7:6] DSP_L2_STATEST
Memory Area – State Status	DSP_L1	PM_DSP_PWRSTST[5:4] DSP_L1_STATEST
Power Domain – State Transition Status		PM_DSP_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_DSP_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_DSP_PWRSTST[1:0] POWERSTATEST

3.7.3 PD_CUSTEFUSE Description

PD_CUSTEFUSE contains the following reset domains:

- CUSTEFUSE_RST

PD_CUSTEFUSE contains the CD_CUSTEFUSE clock domain.

Table 3-241 lists the logic retention capability for each module of the power domain.

Table 3-246. PD_CUSTEFUSE Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
EFUSE_CTRL_CUST	No	RM_CUSTEFUSE_EFUSE_CTRL_CUST_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.3.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.3.1.1 Logic and Memory Area Power Modes

Table 3-242 lists the power modes supported by the logic area of the power domain.

Table 3-247. PD_CUSTEFUSE Logic Area Power Modes

Retention-CSWR	On-Inactive	On-Active
N/A	Available	Available

Table 3-243 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On and Logic Retention columns in the table identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

There is no memory bank implemented for the PD_CUSTEFUSE.

3.7.3.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-244 lists the power mode controls for the power domain.

Table 3-248. PD_CUSTEFUSE Power Modes Control Parameters

Parameter Name	Control Bit Field	Access Type
Power Domain – Low-Power State Change Control	PM_CUSTEFUSE_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Power Domain – State Transition Control	PM_CUSTEFUSE_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-245 lists the power mode status for the power domain.

Table 3-249. PD_CUSTEFUSE Power Modes Status Parameters

Parameter Name	Status Bit Field
Power Domain – Last Power State Entered Status	PM_CUSTEFUSE_PWRSTST[25:24] LASTPOWERSTATEENTERED
Power Domain – State Transition Status	PM_CUSTEFUSE_PWRSTST[20] INTRANSITION
Logic Area – State Status	PM_CUSTEFUSE_PWRSTST[2] LOGICSTATEST
Power Domain – State Status	PM_CUSTEFUSE_PWRSTST[1:0] POWERSTATEST

3.7.4 PD_MPU Description

PD_MPU contains the following reset domains:

- MPU_PWRON_RST
- MPU_RST
- MPU_MA_RST
- MPU_MA_RET_RST
- MPU_MA_PWRON_RET_RST

PD_MPU contains the CD_MPU clock domain.

Table 3-250 lists the logic retention capability for each module of the power domain.

Table 3-250. PD_MPU Module Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
MPU	Partial	RM_MPU_MPU_CONTEXT[0] LOSTCONTEXT_DFF	RM_MPU_MPU_CONTEXT[1] LOSTCONTEXT_RFF

3.7.4.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.4.1.1 Logic and Memory Area Power Modes

Table 3-251 lists the power modes supported by the logic area of the power domain.

Table 3-251. PD_MPU Logic Area Power Modes

Retention-CSWR	On-Inactive	On-Active
Available	Available	Available

Table 3-252 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On and Logic Retention columns in the table identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-252. PD_MPU Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention
MPU_L2		ON	RETENTION
	MPU – MPU_L2	always_on	software_control
MPU_RAM		ON	RETENTION
	MPU - MPU_RAM	always_on	software_control

3.7.4.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-253 lists the power mode controls for the power domain.

Table 3-253. PD_MPU Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (logic in RETENTION state)	MPU_L2	PM_MPU_PWRSTCTRL[9] MPU_L2_RETSTATE	Read/write
Memory Area – State Control (logic in RETENTION state)	MPU_RAM	PM_MPU_PWRSTCTRL[10] MPU_RAM_RETSTATE	Read only

Table 3-253. PD_MPU Power Modes Control Parameters (continued)

Parameter Name	Memory Bank	Control Bit Field	Access Type
Power Domain – Low-Power State Change Control		PM_MPU_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read only
Logic Area – Retention State Control		PM_MPU_PWRSTCTRL[2] LOGICRETSTATE	Read/write
Memory Area – State Control (logic in ON state)	MPU_L2	PM_MPU_PWRSTCTRL[19:18] MPU_L2_ONSTATE	Read only
Memory Area – State Control (logic in ON state)	MPU_RAM	PM_MPU_PWRSTCTRL[21:20] MPU_RAM_ONSTATE	Read only
Power Domain – State Transition Control		PM_MPU_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-254 lists the status of the power modes for the power domain.

Table 3-254. PD_MPU Power Mode Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain – Last Power State Entered Status		PM_MPU_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area – State Status	MPU_L2	PM_MPU_PWRSTST[7:6] MPU_L2_STATEST
Memory Area – State Status	MPU_RAM	PM_MPU_PWRSTST[9:8] MPU_RAM_STATEST
Power Domain – State Transition Status		PM_MPU_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_MPU_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_MPU_PWRSTST[1:0] POWERSTATEST

3.7.4.1.3 Power State Override

The PRCM module controls the power state of the MPU subsystem, whereas the PRCM_MPU controls the power state of each CPU (CPU0 and CPU1). The MPU subsystem requires that the MPU power domain can transition only to a low-power mode when CPU0 and CPU1 are in a lower power mode than is specified in the PM_MPU_PWRSTCTRL register. The power mode of the CPUs is communicated to the PRCM module by the PRCM_MPU through two dedicated internal signals. These two signals specify the lowest power state that the MPU can enter and, if necessary, override the low-power state programmed in the PM_MPU_PWRSTCTRL register.

Table 3-255 lists the low-power modes allowed by the MPU.

Table 3-255. MPU Allowed Low-Power Mode

MPU Allowed Low-Power Mode	Comment
CSWRET	CPUs are in SR3-APG mode and L1$ is in RETENTION state.
INACTIVE	CPUs are in SR3-APG mode and L1$ is in ON state, or CPUs are in INACTIVE state.
ON	CPUs are in ON state.

If PM_MPU_PWRSTCTRL is programmed to a lower power state than allowed (specified by the two signals), then it is overwritten by the hardware. The valued of the PM_MPU_PWRSTCTRL register is not changed (that is, not overwritten).

MPU subsystem guaranties that MPU_LP_ALLOWED[1:0] signals are steady before MPU subsystem STANDBY is asserted.

3.7.5 PD_L3INIT Description

PD_L3INIT contains the following reset domains:

- DPLL_L3INIT_PWRON_RET_RST
- L3INIT_PWRON_RST
- L3INIT_RET_RST
- L3INIT_RST

PD_L3INIT contains the CD_L3INIT clock domain.

Table 3-256 lists the logic retention capability for each module of the power domain.

Table 3-256. PD_L3INIT Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DPLL_USB	Full	None	None
HSI	Full	None	RM_L3INIT_HSI_CONTEXT[1] LOSTCONTEXT_RFF
IEEE1500_2_OCP	No	RM_L3INIT_IEEE1500_2_OCP_CONTEXT[0] LOSTCONTEXT_DFF	None
MMC1	Full	None	RM_L3INIT_MMC1_CONTEXT [1] LOSTCONTEXT_RFF
MMC2	Full	None	RM_L3INIT_MMC2_CONTEXT [1] LOSTCONTEXT_RFF
USB_HOST_HS	Full	None	RM_L3INIT_USB_HOST_HS_CONTEXT[1] LOSTCONTEXT_RFF
USB_OTG_SS	Full	None	RM_L3INIT_USB_OTG_SS_CONTEXT[1] LOSTCONTEXT_RFF
USB_TLL_HS	Full	None	RM_L3INIT_USB_TLL_HS_CONTEXT[1] LOSTCONTEXT_RFF
SATA	No	RM_L3INIT_SATA_CONTEXT[0] LOSTCONTEXT_DFF	None
OCP2SCP1	No	RM_L3INIT_OCP2SCP1_CONTEXT [0] LOSTCONTEXT_DFF	None
OCP2SCP3	No	RM_L3INIT_OCP2SCP3_CONTEXT [0] LOSTCONTEXT_DFF	None

3.7.5.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.5.1.1 Logic and Memory Area Power Modes

Table 3-257 lists the power modes supported by the logic area of the power domain.

Table 3-257. PD_L3INIT Logic Area Power Modes

Retention-CSWR	On-Inactive	On-Active
Available	Available	Available

Table 3-258 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On and Logic Retention columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-258. PD_L3INIT Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention
L3INIT_BANK1		ON	
	HSI – HSI_DMAFIFO	always_on	always_off
	MMC1 – MMC_RAM	always_on	always_off
	MMC2 – MMC_RAM	always_on	always_off
	SATA – sata_bank	always_on	always_off
L3INIT_BANK2		ON	RETENTION
	USB_OTG_SS – USB_MEM	always_on	always_retention

3.7.5.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-259 lists the power modes controls for the power domain.

Table 3-259. PD_L3INIT Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (logic in RETENTION state)	L3INIT_BANK1	PM_L3INIT_PWRSTCTRL[8] L3INIT_BANK1_RETSTATE	Read only
Memory Area – State Control (logic in RETENTION state)	L3INIT_BANK2	PM_L3INIT_PWRSTCTRL[9] L3INIT_BANK2_RETSTATE	Read only
Power Domain – Low-Power State Change Control		PM_L3INIT_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Logic Area – RETENTION State Control		PM_L3INIT_PWRSTCTRL[2] LOGICRETSTATE	Read/write
Memory Area – State Control (logic in ON state)	L3INIT_BANK1	PM_L3INIT_PWRSTCTRL[17:16] L3INIT_BANK1_ONSTATE	Read only
Memory Area – State Control (logic in ON state)	L3INIT_BANK2	PM_L3INIT_PWRSTCTRL[19:18] L3INIT_BANK2_ONSTATE	Read only
Power Domain – State Transition Control		PM_L3INIT_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-260 lists the status of the power modes for the power domain.

Table 3-260. PD_L3INIT Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain – Last Power State Entered Status		PM_L3INIT_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area – State Status	L3INIT_BANK1	PM_L3INIT_PWRSTST[5:4] L3INIT_BANK1_STATEST
Memory Area – State Status	L3INIT_BANK2	PM_L3INIT_PWRSTST[7:6] L3INIT_BANK2_STATEST
Power Domain – State Transition Status		PM_L3INIT_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_L3INIT_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_L3INIT_PWRSTST[1:0] POWERSTATEST

3.7.6 PD_IVA Description

PD_IVA contains the following reset domains:

- IVA_PWRON_RST
- IVA_RST
- IVA_SEQ1_RST

- IVA_SEQ2_RST

PD_IVA contains the CD_IVA clock domain.

Table 3-261 lists the logic retention capability for each module of the power domain.

Table 3-261. PD_IVA Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
IVA	No	RM_IVA_IVA_CONTEXT[0] LOSTCONTEXT_DFF	None
SL2	No	RM_IVA_SL2_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.6.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.6.1.1 Logic and Memory Area Power Modes

Table 3-262 lists the power modes supported by the logic area of the power domain.

Table 3-262. PD_IVA Logic Area Power Modes

Retention-CSWR	On-Inactive	On-Active
Not available	Available	Available

Table 3-263 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On and Logic Retention columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-263. PD_IVA Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention
HWA_MEM		ON	
	IVA – HWA_MEM	always_on	always_off
SL2_MEM		ON	RETENTION
	SL2 – SL2MEM	always_on	software_control
TCM_1_MEM		ON	RETENTION
	IVA – TCM_1	always_on	software_control
TCM_2_MEM		ON	RETENTION
	IVA – TCM_2	always_on	software_control

3.7.6.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-264 lists the power mode controls for the power domain.

Table 3-264. PD_IVA Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (logic in RETENTION state)	SL2_MEM	PM_IVA_PWRSTCTRL[9] SL2_MEM_RETSTATE	Read/write
Memory Area – State Control (logic in RETENTION state)	HWA_MEM	PM_IVA_PWRSTCTRL[8] HWA_MEM_RETSTATE	Read only

Table 3-264. PD_IVA Power Modes Control Parameters (continued)

Parameter Name	Memory Bank	Control Bit Field	Access Type
Power Domain – Low-Power State Change Control		PM_IVA_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Memory Area – State Control (logic in ON state)	TCM_2_MEM	PM_IVA_PWRSTCTRL[23:22] TCM2_MEM_ONSTATE	Read only
Memory Area – State Control (logic in ON state)	TCM_1_MEM	PM_IVA_PWRSTCTRL[21:20] TCM1_MEM_ONSTATE	Read only
Logic Area – Retention State Control		PM_IVA_PWRSTCTRL[2] LOGICRETSTATE	Read only
Memory Area – State Control (logic in ON state)	SL2_MEM	PM_IVA_PWRSTCTRL[19:18] SL2_MEM_ONSTATE	Read only
Memory Area – State Control (logic in ON state)	HWA_MEM	PM_IVA_PWRSTCTRL[17:16] HWA_MEM_ONSTATE	Read only
Memory Area – State Control (logic in RETENTION state)	TCM_2_MEM	PM_IVA_PWRSTCTRL[11] TCM2_MEM_RETSTATE	Read/write
Memory Area – State Control (logic in RETENTION state)	TCM_1_MEM	PM_IVA_PWRSTCTRL[10] TCM1_MEM_RETSTATE	Read/write
Power Domain – State Transition Control		PM_IVA_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-265 lists the status of the power modes for the power domain.

Table 3-265. PD_IVA Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain – Last Power State Entered Status		PM_IVA_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area – State Status	TCM_1_MEM	PM_IVA_PWRSTST[9:8] TCM1_MEM_STATEST
Memory Area – State Status	SL2_MEM	PM_IVA_PWRSTST[7:6] SL2_MEM_STATEST
Memory Area – State Status	HWA_MEM	PM_IVA_PWRSTST[5:4] HWA_MEM_STATEST
Power Domain – State Transition Status		PM_IVA_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_IVA_PWRSTST[2] LOGICSTATEST
Memory Area – State Status	TCM_2_MEM	PM_IVA_PWRSTST[11:10] TCM2_MEM_STATEST
Power Domain – State Status		PM_IVA_PWRSTST[1:0] POWERSTATEST

3.7.7 PD_GPU Description

The GPU_RST reset domain and the CD_GPU clock domain belong to PD_GPU.

Table 3-266 lists the logic retention capability for each module of the power domain.

Table 3-266. PD_GPU Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
GPU	No	RM_GPU_GPU_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.7.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.7.1.1 Logic and Memory Area Power Modes

Table 3-267 lists the power modes supported by the logic area of the power domain.

Table 3-267. PD_GPU Logic Area Power Modes

Retention-CSWR	On-Inactive	On-Active
Not available	Available	Available

Table 3-268 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On and Logic Retention columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-268. PD_GPU Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention
GPU_MEM		ON	
	GPU – GPU_MEM	always_on	always_off

3.7.7.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-269 lists the power mode controls for the power domain.

Table 3-269. PD_GPU Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Power Domain – Low-Power State Change Control		PM_GPU_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Memory Area – State Control (logic in ON state)	GPU_MEM	PM_GPU_PWRSTCTRL[17:16] GPU_MEM_ONSTATE	Read only
Power Domain – State Transition Control		PM_GPU_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-270 lists the status of the power modes for the power domain.

Table 3-270. PD_GPU Power Mode Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Memory Area – State Status	GPU_MEM	PM_GPU_PWRSTST[5:4] GPU_MEM_STATEST
Power Domain – Last Power State Entered Status		PM_GPU_PWRSTST[25:24] LASTPOWERSTATEENTERED
Power Domain – State Transition Status		PM_GPU_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_GPU_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_GPU_PWRSTST[1:0] POWERSTATEST

3.7.8 PD_EMU Description

PD_EMU contains the following reset domains:

- EMU_EARLY_PWRON_RST
- EMU_PWRON_RST
- EMU_RST

PD_EMU contains the CD_EMU clock domain.

Table 3-271 lists the logic retention capability for each module of the power domain.

Table 3-271. PD_EMU Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DEBUGSS logic	No	RM_EMU_DEBUGSS_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.8.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.8.1.1 Logic and Memory Area Power Modes

Table 3-272 lists the power modes supported by the logic area of the power domain.

Table 3-272. PD_EMU Logic Area Power Modes

Retention-CSWR	On-Inactive	On-Active
Not available	Not available	Available

Table 3-273 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-273. PD_EMU Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention
EMU_BANK		ON	
	DEBUGSS – DebugSS_MEM	always_on	always_off

3.7.8.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-274 lists the power modes controls for the power domain.

Table 3-274. PD_EMU Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (logic in ON state)	EMU_BANK	PM_EMU_PWRSTCTRL[17:16] EMU_BANK_ONSTATE	Read only
Power Domain - State Transition Control		PM_EMU_PWRSTCTRL[1:0] POWERSTATE	Read only

NOTE: To minimize leakage of DEBUGSS internal PLL when PD_EMU is switched off, AIPOFF_WKUP is driven high by PRCM. When PD_EMU is switched on, PRCM drives AIPOFF_WKUP to low before PD_EMU reaches ON state.

Table 3-275 lists the status of the power modes for the power domain.

Table 3-275. PD_EMU Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Memory Area – State Status	EMU_BANK	PM_EMU_PWRSTST[5:4] EMU_BANK_STATEST
Power Domain – Last Power State Entered Status		PM_EMU_PWRSTST[25:24] LASTPOWERSTATEENTERED

Table 3-275. PD_EMU Power Modes Status Parameters (continued)

Parameter Name	Memory Bank	Status Bit Field
Power Domain – State Transition Status		PM_EMU_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_EMU_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_EMU_PWRSTST[1:0] POWERSTATEST

3.7.9 PD_DSS Description

PD_DSS contains the following reset domains:

- DSS_RET_RST
- DSS_RST

PD_DSS contains the CD_DSS clock domain.

Table 3-276 lists the logic retention capability for each module of the power domain.

Table 3-276. PD_DSS Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DSS	Partial	RM_DSS_DSS_CONTEXT[0] LOSTCONTEXT_DFF	RM_DSS_DSS_CONTEXT[1] LOSTCONTEXT_RFF
BB2D	None	RM_DSS_BB2D_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.9.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.9.1.1 Logic and Memory Area Power Modes

Table 3-277 lists the power modes supported by the logic area of the power domain.

Table 3-277. PD_DSS Logic Area Power Modes

Retention-CSWR	On-Inactive	On-Active
N/A	Available	Available

Table 3-278 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On and Logic Retention columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-278. PD_DSS Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention
DSS_MEM		ON	
	DSS – DSSMEM	always_on	always_off
	BB2D - BB2D_MEM	always_on	always_off

3.7.9.1.2 Logic and Memory Area Power Mode Control and Status

Table 3-279 lists the power modes controls for the power domain.

Table 3-279. PD_DSS Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (logic in RETENTION state)	DSS_MEM	PM_DSS_PWRSTCTRL[8] DSS_MEM_RETSTATE	Read only
Power Domain – Low-Power State Change Control		PM_DSS_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Logic Area – RETENTION State Control		PM_DSS_PWRSTCTRL[2] LOGICRETSTATE	Read only
Memory Area – State Control (logic in ON state)	DSS_MEM	PM_DSS_PWRSTCTRL[17:16] DSS_MEM_ONSTATE	Read only
Power Domain – State Transition Control		PM_DSS_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-280 lists the status of the power modes for the power domain.

Table 3-280. PD_DSS Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Memory Area – State Status	DSS_MEM	PM_DSS_PWRSTST[5:4] DSS_MEM_STATEST
Power Domain – Last Low Power State Entered Status		PM_DSS_PWRSTST[25:24] LASTPOWERSTATEENTERED
Power Domain – State Transition Status		PM_DSS_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_DSS_PWRSTST[2] LOGICSTATEST
Power Domain – Current Power State Status		PM_DSS_PWRSTST[1:0] POWERSTATEST

3.7.10 PD_CORE Description

PD_CORE contains the following reset domains:

- CM_CORE_PWRON_RET_RST
- CM_CORE_RET_RST
- CORE_PWRON_RET_RST
- CORE_PWRON_RST
- CORE_RET_RST
- CORE_RST
- DLL_RST
- IPU_PWRON_RST
- IPU_RET_RST
- IPU_CPU0_RST
- IPU_CPU1_RST
- IPU_RST
- EMIF_DDR_PHY_PWRON_RST
- DMA_RET_RST

PD_CORE contains the following clock domains:

- CD_DMA
- CD_IPU
- CD_EMIF
- CD_L3_MAIN1
- CD_L3_MAIN2
- CD_L3_INSTR

- CD_L4_CFG
- CD_L4_PER
- CD_L4_SEC

Table 3-281 lists the logic retention capability for each module of the power domain.

Table 3-281. PD_CORE Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
CONTROL_MODULE_CORE	Full	None	None
CONTROL_MODULE_BANDGAP	No	None	None
CM_CORE	Full	None	None

3.7.10.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.10.1.1 Logic and Memory Area Power Modes

Table 3-282 lists the power modes supported by the logic area of the power domain.

Table 3-282. PD_CORE Logic Area Power Modes

Retention-CSWR	On-Inactive	On-Active
Available	Available	Available

Table 3-283 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On and Logic Retention columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-283. PD_CORE Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention
CORE_NRET_BANK		ON	
	DMM – DMM_MEMBANK2	always_on	always_off
	OCP_WP_NOC – OCPWP_BANK	always_on	always_off
	MMC3 - MMC_RAM	always_on	always_off
	MMC4 - MMC_RAM	always_on	always_off
	MMC5 - MMC_RAM	always_on	always_off
	FPKA - pka_mem	always_on	always_off
CORE_OCMRAM		ON	RETENTION

Table 3-283. PD_CORE Memory Area Power Modes (continued)

Memory Bank	Module – Memory	Logic On	Logic Retention
	OCMC_RAM – OCMC_RAM_Bank1	always_on	always_retention
CORE_OTHER_BANK		ON	RETENTION
	DMA_SYSTEM – DMA_MEM	always_on	always_retention
	DMM – DMM_MEMBANK1	always_on	always_retention
	DMA_CRYPTO - DMA_CRYPTO_MEM	always_on	always_retention
	UART1 - UART_MEM	always_on	always_retention
	UART2 - UART_MEM	always_on	always_retention
	UART3 - UART_MEM	always_on	always_retention
	UART4 - UART_MEM	always_on	always_retention
	UART5 - UART_MEM	always_on	always_retention
	UART6 - UART_MEM	always_on	always_retention
IPU_L2RAM		ON	RETENTION
	IPU – IPU_L2RAM_MEM	always_on	software_control
IPU_UNICACHE		ON	RETENTION
	IPU – IPU_UNICACHE_mem	always_on	software_control

3.7.10.1.2 Logic and Memory Area Power Mode Control and Status

Table 3-284 lists the power mode controls for the power domain.

Table 3-284. PD_CORE Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (Logic in RETENTION state)	CORE_OCMRAM	PM_CORE_PWRSTCTRL[9] CORE_OCMRAM_RETSTATE	Read only
Memory Area – State Control (Logic in RETENTION state)	CORE_OTHER_BANK	PM_CORE_PWRSTCTRL[8] CORE_OTHER_BANK_RETSTATE	Read only
Memory Area – State Control (Logic in ON state)	CORE_NRET_BANK	PM_CORE_PWRSTCTRL[25:24] OCP_NRET_BANK_ONSTATE	Read only
Memory Area – State Control (Logic in ON state)	IPU_UNICACHE	PM_CORE_PWRSTCTRL[23:22] IPU_UNICACHE_ONSTATE	Read only
Memory Area – State Control (Logic in ON state)	IPU_L2RAM	PM_CORE_PWRSTCTRL[21:20] IPU_L2RAM_ONSTATE	Read only
Memory Area – State Control (Logic in ON state)	CORE_OCMRAM	PM_CORE_PWRSTCTRL[19:18] CORE_OCMRAM_ONSTATE	Read only
Memory Area – State Control (Logic in ON state)	CORE_OTHER_BANK	PM_CORE_PWRSTCTRL[17:16] CORE_OTHER_BANK_ONSTATE	Read only
Memory Area – State Control (Logic in RETENTION state)	CORE_NRET_BANK	PM_CORE_PWRSTCTRL[12] OCP_NRET_BANK_RETSTATE	Read only
Memory Area – State Control (Logic in RETENTION state)	IPU_UNICACHE	PM_CORE_PWRSTCTRL[11] IPU_UNICACHE_RETSTATE	Read/write
Memory Area – State Control (Logic in RETENTION state)	IPU_L2RAM	PM_CORE_PWRSTCTRL[10] IPU_L2RAM_RETSTATE	Read/write
Logic Area – RETENTION State Control	N/A	PM_CORE_PWRSTCTRL[2] LOGICRETSTATE	Read/write
Power Domain – Low-Power State Change Control	N/A	PM_CORE_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Power Domain – State Transition Control	N/A	PM_CORE_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-285 lists the status of the power modes for the power domain.

Table 3-285. PD_CORE Power Mode Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain – Last Power State Entered Status		PM_CORE_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area – State Status	IPU_L2RAM	PM_CORE_PWRSTST[9:8] IPU_L2RAM_STATEST
Memory Area – State Status	CORE_OCMRAM	PM_CORE_PWRSTST[7:6] CORE_OCMRAM_STATEST
Memory Area – State Status	CORE_OTHER_BANK	PM_CORE_PWRSTST[5:4] CORE_OTHER_BANK_STATEST
Memory Area – State Status	CORE_NRET_BANK	PM_CORE_PWRSTST[13:12] OCP_NRET_BANK_STATEST
Memory Area – State Status	IPU_UNICACHE	PM_CORE_PWRSTST[11:10] IPU_UNICACHE_STATEST
Logic Area – State Status		PM_CORE_PWRSTST[2] LOGICSTATEST
Power Domain – State Transition Status		PM_CORE_PWRSTST[20] INTRANSITION
Power Domain – State Status		PM_CORE_PWRSTST[1:0] POWERSTATEST

3.7.11 PD_CAM Description

PD_CAM contains the CAM_RST reset domain.

PD_CAM contains the CD_CAM clock domain.

Table 3-286 lists the logic retention capability for each module of the power domain.

Table 3-286. PD_CAM Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
FDIF	No	RM_CAM_FDIF_CONTEXT[0] LOSTCONTEXT_DFF	None
ISS	No	RM_CAM_ISS_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.11.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.11.1.1 Logic and Memory Area Power Modes

Table 3-287 lists the power modes supported by the logic area of the power domain.

Table 3-287. PD_CAM Logic Area Power Modes

Retention-CSWR	On-Inactive	On-Active
Not available	Available	Available

Table 3-288 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On and Logic Retention columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-288. PD_CAM Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention
CAM_MEM		ON	
	FDIF – FDIFMEM	always_on	always_off
	ISS – ISSMEM	always_on	always_off

3.7.11.1.2 Logic and Memory Area Power Mode Control and Status

Table 3-289 lists the power mode controls for the power domain.

Table 3-289. PD_CAM Power Mode Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Power Domain – Low-Power State Change Control		PM_CAM_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Memory Area – State Control (Logic in ON state)	CAM_MEM	PM_CAM_PWRSTCTRL[17:16] CAM_MEM_ONSTATE	Read only
Power Domain – State Transition Control		PM_CAM_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-290 lists the status of the power modes for the power domain.

Table 3-290. PD_CAM Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Memory Area – State Status	CAM_MEM	PM_CAM_PWRSTST[5:4] CAM_MEM_STATEST

3.7.12.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.12.1.1 Logic and Memory Area Power Modes

Table 3-292 lists the power modes supported by the logic area of the power domain.

Table 3-292. PD_ABE Logic Area Power Modes

Retention-CSWR	On-Inactive	On-Active
Not available	Available	Available

Table 3-293 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-293. PD_ABE Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention
AESSMEM		ON	RETENTION
	AESS – AESS_MemBank1	always_on	always_retention
PERIPHMEM		ON	
	DMIC – DMIC_BANK	always_on	always_off
	MCBSP1 – MCBSP_BANK	always_on	always_off
	MCBSP2 – MCBSP_BANK	always_on	always_off
	MCBSP3 – MCBSP_BANK	always_on	always_off
	MCPDM – MCPDM_BANK	always_on	always_off

3.7.12.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-294 lists the power modes controls for the power domain.

Table 3-294. PD_ABE Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (logic in RETENTION state)	AESSMEM	PM_ABE_PWRSTCTRL[8] AESSMEM_RETSTATE	Read only
Memory Area – State Control (logic in ON state)	PERIPHMEM	PM_ABE_PWRSTCTRL[21:20] PERIPHMEM_ONSTATE	Read only
Memory Area – State Control (logic in ON state)	AESSMEM	PM_ABE_PWRSTCTRL[17:16] AESSMEM_ONSTATE	Read only

3.7.13 PD_MPUAON Description

PD_MPUAON contains the following reset domains:

- MPUAON_RST
- DPLL_MPU_PWRON_RST

PD_MPUAON has no associated clock domains.

Table 3-296 lists the logic retention capability for each module of the power domain.

Table 3-296. PD_MPUAON Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DPLL_MPU	No	None	None
INTC_MPU	No	None	None

3.7.13.1 Power Domain Modes

The PD_MPUAON power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power-state control or status bit field for this power domain.

The PD_MPUAON power domain has no memory banks.

3.7.14 PD_MMAON Description

PD_MMAON contains the following reset domains:

- MMAON_RST
- DPLL_IVA_PWRON_RST

PD_MMAON has no associated clock domains.

Table 3-297 lists the logic retention capability for each module of the power domain.

Table 3-297. PD_MMAON Module Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DPLL_IVA	No	None	None
WUGEN_DSP	No	None	None

3.7.14.1 Power Domain Modes

The PD_MMAON power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power-state control or status bit field for this power domain.

The PD_MMAON power domain has no memory banks.

3.7.15 PD_COREAON Description

PD_COREAON contains the following reset domains:

- CM_CORE_AON_PWRON_RST
- CM_CORE_AON_RST
- COREAON_PWRON_RST
- COREAON_RST

PD_COREAON contains the CD_COREAON_L4 clock domain.

Table 3-298 lists the logic retention capability for each module of the power domain.

Table 3-298. PD_COREAON Module Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
CM_CORE_AON	No	None	None
DPLL_ABE	No	None	None
DPLL_CORE	No	None	None
DPLL_PER	No	None	None
IO_SRCOMP_CORE	No	None	None
WUGEN_IPU	No	None	None
WUGEN_DMA_SYSTEM	No	None	None
SMARTREFLEX_CORE	No	RM_COREAON_SMARTREFLEX_CORE_CONTEXT[0] LOSTCONTEXT_DFF	None
SMARTREFLEX_MM	No	RM_COREAON_SMARTREFLEX_MM_CONTEXT[0] LOSTCONTEXT_DFF	None
SMARTREFLEX_MPU	No	RM_COREAON_SMARTREFLEX_MPU_CONTEXT[0] LOSTCONTEXT_DFF	None
SPINNER	No	None	None
USB_PHY_CORE	No	None	None

3.7.15.1 Power Domain Modes

The PD_COREAON power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power-state control or status bit field for this power domain.

The PD_COREAON power domain has no memory banks.

3.8 Voltage-Management Functional Description

This section describes the voltage domains and voltage control architecture. It also explains the interactions between the device and the external power IC.

3.8.1 Overview

The voltage-management architecture of the device is based on voltage sources managed by the PRCM module. They define the voltage domains within the device (see Section 3.1.1.3, *Voltage Management*). This partition of the voltage domains ensures independent voltage control of each voltage domain through dedicated SMPS or LDO. The following voltage domains are managed by the PRCM module:

- VDD_CORE_L
- VDD_MPU_L
- VDD_MM_L
- VDD_WKUP_L
- VDD_CORE_M
- VDD_MM_M
- VDD_MPU_M
- VDD_MM_ABB
- VDD_MPU_ABB

NOTE: For the association of the device power supply pin to the power domain, see Table 3-27.

The PRCM module supports the AVS technique on the VDD_MPU_L, VDD_CORE_L, and VDD_MM_L voltage domains through automatic monitoring and adjustments of voltages by their dedicated SmartReflex modules. The VDD_MPU_L voltage domain supports four DVFS OPPs. The VDD_MM_L and VDD_WKUP_L voltage domains support three DVFS OPPs. The VDD_CORE_L voltage domain supports two DVFS OPPs.

The PRCM module also supports the ABB technique on the MPU and MM voltage domains through the VDD_MPU_ABB and VDD_MM_ABB biasing voltages.

The PRCM module automatically scales down VDD_MPU_M, VDD_CORE_M, and VDD_MM_M to retention voltage level whenever all memory banks on these domains transition to the RETENTION power state.

Table 3-299 lists the supported DVFS OPPs for each voltage domain. The exact values depend on the silicon; for more information, see the Data Manual Operating Condition addendum.

Table 3-299. Supported DVFS OPPs Summary

Voltage Domain	Operating Point	Control
VDD_MPU_L (VD_MPU)	RETENTION OPP_LOW OPP_NOM OPP_HIGH OPP_SPEEDBIN	Hardware and software
VDD_MM_L (VD_MM)	RETENTION OPP_LOW OPP_NOM OPP_OD	Hardware and software
VDD_CORE_L (VD_CORE)	RETENTION OPP_NOM	Hardware and software
VDD_WKUP_L (VD_WKUP)	RETENTION OPP_WKUP_ACTIVE OPP_WKUP_EMULATION	Hardware and software

Table 3-299. Supported DVFS OPPs Summary (continued)

Voltage Domain	Operating Point	Control
	OPP_WKUP_SLEEP	

At boot time, the device is set with all two voltage domains (VDD_MPU_L, VDD_MM_L) at OPP_LOW.

VDD_MPU_L (MPU voltage domain) voltage state status can be checked by reading bitfield PRM_VOLTST_MPU[1:0] VOLTSTATEST.

VDD_MM_L (MM voltage domain) voltage state status can be checked by reading bitfield PRM_VOLTST_MM[1:0] VOLTSTATEST.

DVFS OPPs dependencies:

For detailed information about DVFS OPPs dependencies, see the *Data Manual Operating Condition Addendum*.

Other OPPs limitations:

- When exiting from off (no power source) mode, voltage values for MPU, MM domains must be at OPP_LOW.

3.8.2 Voltage-Control Architecture

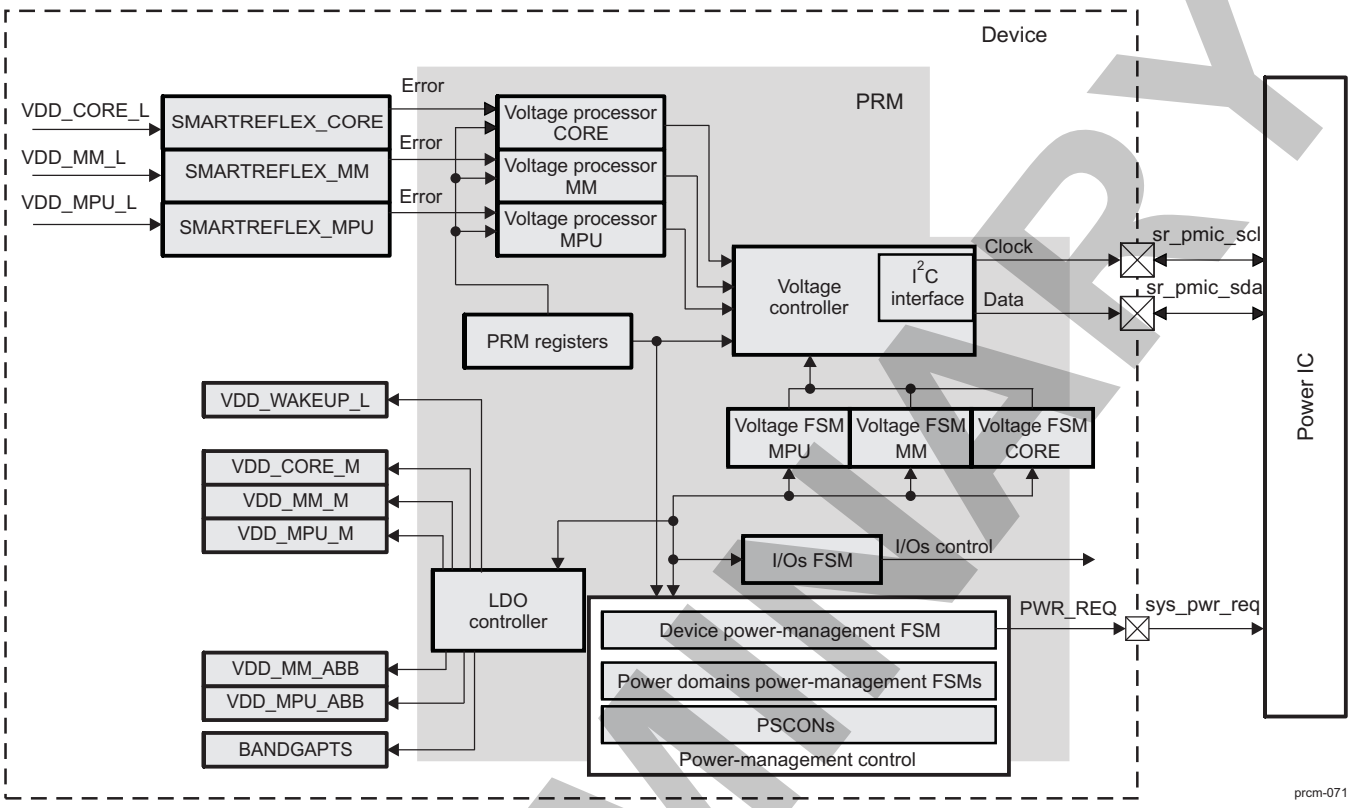
The PRM is split over several blocks that manage the different voltage sources.

- Voltage processors for converting SmartReflex data to voltage values before sending to the voltage controller
- Voltage FSMs for managing VDD_MPU_L, VDD_MM_L voltages (hardware control of voltages). They send commands to the voltage controller (I^2C mode).
- A voltage controller for gathering commands from the PRCM module register (direct access), voltage processors, and voltage FSMs. It then handles communication with the external power IC through the dedicated I^2C interface.
- A device FSM for managing the voltage FSMs and I/O wake-up control and system clock control sequencing during device sleep and wake-up transitions
- LDO regulator controllers for ABB management, memory array voltage management, and wake-up logic.
- BANDGAPs reference voltage sleep control

NOTE: The SmartReflex module allows dynamic voltage adjustments around an OPP voltage level to ensure target performance. It also allows switching from one OPP to another. However, it does not control voltage switching of the voltage domain to RETENTION level when all power domains within the power domain are in RETENTION power state. This is handled by the voltage FSMs.

Figure 3-77 shows the architecture for PRM voltage control.

Figure 3-77. PRM Voltage Control Architecture



3.8.3 VDD_MPU_L, VDD_CORE_L, and VDD_MM_L Control

These power supply sources can be controlled using PRM dedicated I²C control.

3.8.3.1 PRM Dedicated I²C Control

The PRM I²C interface is dedicated to SmartReflex voltage control. It enables the voltage controller to send voltage commands to the external power IC. To reduce latency of voltage changes, the voltage controller is configurable to run in HS I²C mode. The PRM I²C interface supports multimaster mode.

The voltage controller receives voltage control commands from the following input ports:

- Voltage processors ports: Each voltage processor sends voltage change commands to the voltage controller depending on the information received from the associated SmartReflex module.
- Voltage PRCM ports: Each voltage PRCM sends commands to the voltage controller when the device enters RETENTION or off (no power supply) power state, and also when the device wakes up.
- PRM register port: The PRM registers give direct software control over the voltage levels of the external voltage sources.

An arbitration scheme in the voltage controller manages concurrent requests on different ports.

Each internal port has a handshake to indicate when the I²C frame that results from the request on that port is acknowledged by the external power IC.

The PRM can also send external voltage source sleep commands that can be used to activate power IC sleep mode, where the voltage regulator maintains output voltage but only a small load is supported. This also lets the external power IC reduce its power consumption.

NOTE: An I^2C interface not controlled by the PRM can be used to program the voltage levels of the external power IC. Because the I^2C interface is not a hardware-controlled interface, its use is restricted to moving the voltage level from one OPP to another.

In this case, the control software must operate the voltage transition when device activity allows one.

3.8.3.2 Adaptive Voltage Scaling

As explained in Section 3.1.2.4, *Adaptive Voltage Scaling*, the SmartReflex technology uses adaptive power supply to reduce active power consumption. With SmartReflex, the power supply voltage can be adapted to the silicon performance statically (for example, adapted to the manufacturing process of a given device) or dynamically (for example, adapted to the temperature-induced current performance of the device).

SmartReflex voltage control in the device is based on the dedicated SmartReflex modules and the voltage processors, in addition to the voltage controller with a dedicated I^2C interface, which are shared with the voltage PRCM modules and voltage control registers.

The SmartReflex modules allow a continuous real-time monitoring of the voltage supply and device performance to:

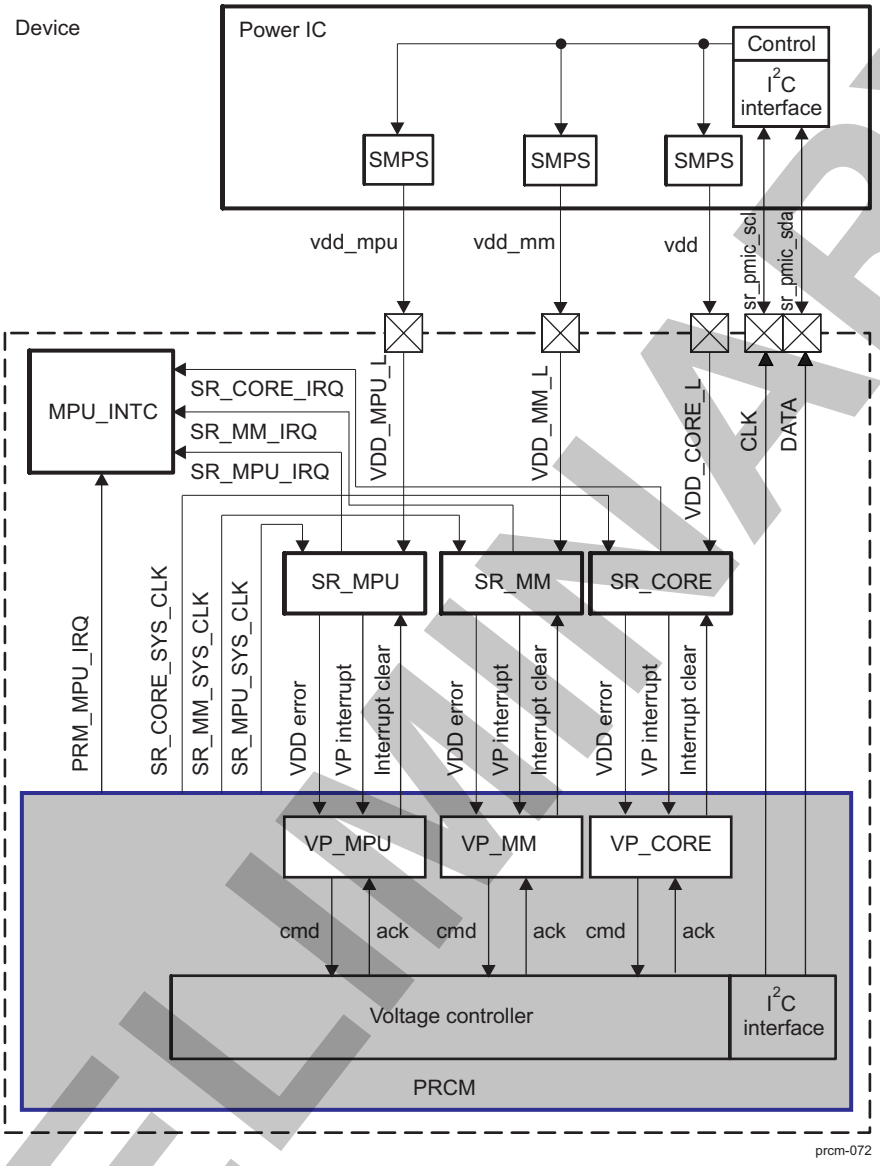
- Minimize the supply voltage to reduce the device power consumption
- Maintain the desired device performance (by dynamically adjusting the device voltage) as the temperature of the device varies

Because the SmartReflex modules and the voltage processors are dedicated to SmartReflex voltage control, they are described together in this section.

3.8.3.2.1 SmartReflex in the Device

Figure 3-78 shows the SmartReflex integration.

Figure 3-78. SmartReflex Integration



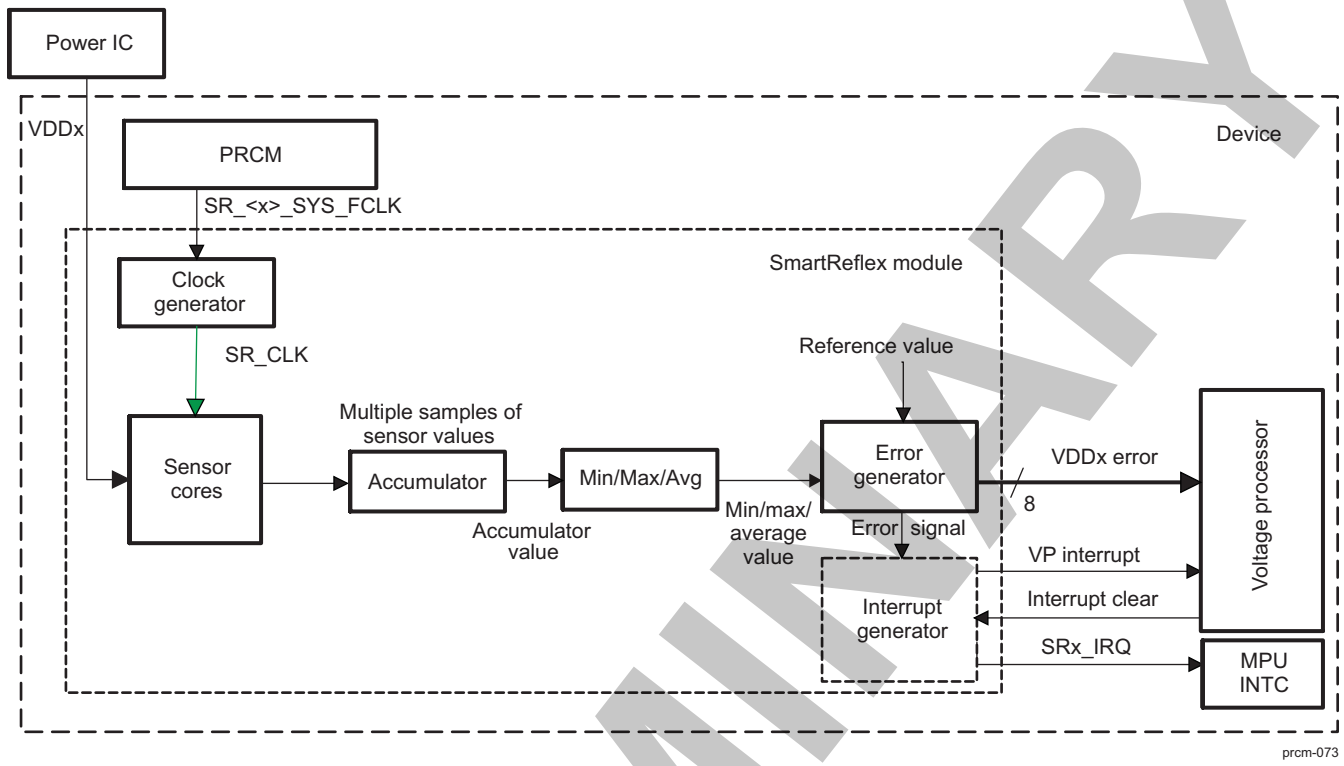
SmartReflex voltage control in the device is implemented for simultaneous control of three independent voltage sources. One SmartReflex module controls the VDD_CORE_L voltage, the second one is dedicated to VDD_MM_L control, and the third controls the VDD_MPU_L voltage. Each SmartReflex module is connected to a voltage processor. Voltage commands from all voltage processors are passed to a voltage control, which sends them through a dedicated I^2C master interface to the power IC.

SmartReflex modules are in the PD_COREAON power domain and supplied by the VDD_CORE_L voltage domain. Each module senses its own voltage domain (VDD_CORE_L, VDD_MM_L, or VDD_MPU_L).

3.8.3.2.2 SmartReflex Module

Figure 3-79 is a functional overview of the SmartReflex module.

Figure 3-79. SmartReflex Module Functional Overview



3.8.3.2.3 SmartReflex Submodules

NOTE: In this and the following section, SMARTREFLEXn refers to the SMARTREFLEX_MM, SMARTREFLEX_MPU, and SMARTREFLEX_CORE SmartReflex modules.

The SmartReflex module is enabled by setting the SMARTREFLEXn.SRCONFIG[11] SRENABLE bit. The SmartReflex module is composed of six blocks:

- Clock generator
- Sensor core
- Accumulator
- Minimum/maximum/average
- Error generator
- Interrupt generator

Clock Generator

The clock generator provides the internal SMARTREFLEX_CLK sampling clock to the sensor core of the module. The SMARTREFLEXn.SRCONFIG[21:12] SRCLKLENGTH bit field allows the setting of the frequency divider ratio between SMARTREFLEXn_SYS_CLK and the SMARTREFLEX_CLK. It is calculated using Equation 1:

$$\text{SMARTREFLEXn.SRCONFIG[21:12] SRCLKLENGTH} = f_{\text{SMARTREFLEXn\_SYS\_CLK}} / (2 * f_{\text{SMARTREFLEX\_CLK}}) \quad (1)$$

Where $f_{\text{SMARTREFLEXn\_SYS\_CLK}}$ is the frequency of the SMARTREFLEXn_SYS_CLK, and $f_{\text{SMARTREFLEX\_CLK}}$ is the desired SMARTREFLEX_CLK frequency.

To make accurate use of the target values programmed for the SmartReflex modules in the device, the SRCLKLENGTH parameter must be set correctly. The target values for the SmartReflex modules are calculated with the SMARTREFLEX_CLK frequency set at 100 kHz. It is thus mandatory that the value of the SRCLKLENGTH parameter is calculated from Equation 1 with $f_{\text{SMARTREFLEX\_CLK}}$ set at 100 kHz.

For example, if the system clock has a frequency of 38.4 MHz, and the target SMARTREFLEX_CLK frequency is 100 kHz, the SMARTREFLEXn.SRCONFIG[21:12] SRCLKLENGTH bit field is 192 (0x0C0).

Sensor Core

The sensor cores (SVT and LVT) receive the SMARTREFLEX_CLK sampling clock and the voltage to be sensed. They generate sensor value samples proportional to the voltage sensed. For accuracy, a sensor core is composed of two sensors (N and P) and generates two values per sample (one from each sensor).

Two sample values generated by the SVT sensor core output can be read from the SMARTREFLEXn.SENVAL[15:0] SENNVAL and SMARTREFLEXn.SENVAL[31:16] SENPVAL bit fields. The other two sample values generated by the LVT sensor core output can be read from the SMARTREFLEXn.LVTSENVAL[15:0] LVTSENNVAL and SMARTREFLEXn.LVTSENVAL[31:16] LVTSENPVAL bit fields.

The SVT sensor core is enabled by the SMARTREFLEXn.SRCONFIG[10] SENENABLE bit. The LVT sensor core is enabled by the SMARTREFLEXn.SRCONFIG[4] LVTSENENABLE bit.

Accumulator

The accumulator consists of two stacks that store multiple samples of the four sensor values received from the sensor cores.

The SMARTREFLEXn.SRCONFIG[31:22] ACCUMDATA bit field defines the size of the accumulator in the number of samples to be stored. The allowable range is from 2 to 1023. The value of the SMARTREFLEXn.SRCONFIG[31:22] ACCUMDATA bit field is related to the desired sampling time window ($T_{TimeWindow}$) and the SMARTREFLEX_CLK frequency ($f_{SMARTREFLEX\_CLK}$). It can be calculated using Equation 2:

$$\text{SMARTREFLEXn.SRCONFIG[31:22] ACCUMDATA} = T_{TimeWindow} * f_{SMARTREFLEX\_CLK} \quad (2)$$

For example, for an accumulator time window of 10 ms and SMARTREFLEX_CLK frequency of 32 kHz, the value of SMARTREFLEXn.SRCONFIG[31:22] ACCUMDATA is 320 (0x140). The accumulation window must be large enough so that the minimum, maximum, and average counter values are accurate.

Minimum/Maximum/Average

The minimum/maximum/average block reads the samples stored in the accumulator and returns the minimum, maximum, and average values of the samples. Because the accumulator contains four separate groups of samples (one from each sensor of the sensor cores), the minimum/maximum/average block also generates four sets of minimum, maximum, and average values.

The minimum, maximum, and average values of the samples of the first SVT sensor can be read from the SMARTREFLEXn.SENMIN[15:0] SENNMIN, SMARTREFLEXn.SENMAX[15:0] SENNMAX, and SMARTREFLEXn.SENAVG[15:0] SENNAVG bit fields. The minimum, maximum, and average values of the samples of the first LVT sensor can be read from the following bit fields:

- SMARTREFLEXn.LVTSENMIN[15:0] LVTSENNMIN
- SMARTREFLEXn.LVTSENMAX[15:0] SENNMAX
- SMARTREFLEXn.LVTSENAVG[15:0] LVTSENNAVG

For the sample values of the second SVT sensor, the minimum, maximum, and average values can be read from the SMARTREFLEXn.SENMIN[31:16] SENPMIN, SMARTREFLEXn.SENMAX[31:16] SENPMAX, and SMARTREFLEXn.SENAVG[31:16] SENPAVG bit fields. For the sample values of the second LVT sensor, the minimum, maximum, and average values can be read from the following bit fields:

- SMARTREFLEXn.LVTSENMIN[31:16] LVTSENPMIN
- SMARTREFLEXn.LVTSENMAX[31:16] LVTSENPMAX
- SMARTREFLEXn.LVTSENAVG[31:16] LVTSENPAVG

The minimum/maximum/average block is enabled by the SMARTREFLEXn.SRCONFIG[8] MINMAXAVGENABLE bit.

The accumulated values and status registers are reset when one of the following occurs:

- SMARTREFLEXn.SRCONFIG[11] SRENABLE is cleared to 0x0.
- SMARTREFLEXn.IRQSTATUS[3] MCUACCUMINTSTATENA is cleared by writing 0x1 to it.

Error Generator

The error generator block reads the sample value generated by the sensor cores and compares it with a reference value to calculate the error. This error is then passed to the voltage processor and the internal interrupt generator block.

The reference value for a given OPP of the device is configured by setting the following bit fields by reading the corresponding values from the control module (see Section 3.8.3.2.6, *SmartReflex Parameters Set After Silicon Characterization*):

- SMARTREFLEXn.NVALUERECIPROCAL[23:20] SENPGAIN
- SMARTREFLEXn.NVALUERECIPROCAL[19:16] SENNGAIN
- SMARTREFLEXn.NVALUERECIPROCAL[15:8] RNSENP
- SMARTREFLEXn.LVTNVALUERECIPROCAL[23:20] SENPGAIN
- SMARTREFLEXn.NVALUERECIPROCAL[7:0] RNSENN
- SMARTREFLEXn.LVTNVALUERECIPROCAL[19:16] SENNGAIN
- SMARTREFLEXn.LVTNVALUERECIPROCAL[15:8] RNSENP
- SMARTREFLEXn.LVTNVALUERECIPROCAL[7:0] RNSENN

The error generator sets the SMARTREFLEXn.SRSTATUS[1] ERRORGENERATORVALID status bit when a valid error value is set in the SMARTREFLEXn.SENERROR_REG register.

The SMARTREFLEXn.SENERROR_REG register contains the average error (SMARTREFLEXn.SENERROR_REG[15:8] AVGERROR) and the percentage of error (SMARTREFLEXn.SENERROR_REG[7:0] SENERROR).

The error generator block is enabled by the SMARTREFLEXn.SRCONFIG[9] ERRORGENERATORENABLE bit.

In the error generator module, the sensor with the highest frequency error (SVT or LVT) is selected for processing the voltage change request.

Interrupt Generator

The interrupt generator block generates interrupts to INTC_MPU and the voltage processor module (if the corresponding interrupts are enabled) to indicate errors.

Table 3-300 and Table 3-301 list the interrupt events in the SmartReflex module and their enable and status bits.

Table 3-300. SmartReflex Interrupt Events

Interrupt Type	Description
Accumulator	The minimum/maximum/average module has completed computation of the accumulator data.
Valid	The average error is less than 2 percent of the true average error.
Disable acknowledge	The SmartReflex module is disabled and has cleared all INTC_MPU and VP interrupts (internal registers are reset). This interrupt indicates to the software that the SmartReflex module is available for programming.
Bounds	The frequency error has crossed the maximum limit (ERRMAXLIMIT) or the minimum limit (ERRMINLIMIT). It is also mapped to the voltage processor.

The SMARTREFLEXn_IPU_IRQs from SMARTREFLEX_MM and SMARTREFLEX_CORE are mapped to the IPU_IRQ_48 interrupt line of the INTC_IPU.

Table 3-301. SmartReflex Interrupt Events Enable and Status Bits

Interrupt Type	Enable Bit	Status Bit
Accumulator	SMARTREFLEXn.IRQENABLE_SET[3] MCUACCUMINTENSET	SMARTREFLEXn.IRQSTATUS[3] MCUACCUMINTSTATENA
	SMARTREFLEXn.IRQENABLE_CLR[3] MCUACCUMINTENCLR	

Table 3-301. SmartReflex Interrupt Events Enable and Status Bits (continued)

Interrupt Type	Enable Bit	Status Bit
Valid	SMARTREFLEXn.IRQENABLE_SET[2] MCUVALIDINTENSET	SMARTREFLEXn.IRQSTATUS[2] MCUVALIDINTSTATENA
	SMARTREFLEXn.IRQENABLE_CLR[2] MCUVALIDINTENCLR	
Disable acknowledge	SMARTREFLEXn.IRQENABLE_SET[0] MCUDISABLEACKINTENSET	SMARTREFLEXn.IRQSTATUS[0] MCUDISABLEACKINTSTATENA
	SMARTREFLEXn.IRQENABLE_CLR[0] MCUDISABLEACKINTENCLR	
Bounds	SMARTREFLEXn.IRQENABLE_SET[1] MCUBOUNDSINTENSET	SMARTREFLEXn.IRQSTATUS[1] MCUBOUNDSINTSTATENA
	SMARTREFLEXn.IRQENABLE_CLR[1] MCUBOUNDSINTENCLR	
	SMARTREFLEXn.ERRCONFIG[22] VPBOUNDSINTENABLE	SMARTREFLEXn.ERRCONFIG[23] VPBOUNDSINTSTATENA

The minimum and maximum error limits for the bounds interrupt are configured in the SMARTREFLEXn.ERRCONFIG[15:8] ERRMAXLIMIT and SMARTREFLEXn.ERRCONFIG[7:0] ERRMINLIMIT bit fields.

Writing 1 to a bit in the SMARTREFLEXn.IRQSTATUS register clears the interrupt pending status of each interrupt source whose corresponding bit is 1 in the value written. Other interrupt pending status bits are not affected (writing 0 to that bit does not affect the status).

3.8.3.2.4 SmartReflex Convergence Verification

SmartReflex convergence verification is mandatory for the MPU, IVA, and CORE power domains. The goal of this verification is that the VSR (Voltage SmartReflex) is calibrated with SmartReflex within the expected error range. If VSR is calibrated within the expected error range, the calibration is converged without issue. If VSR is not calibrated within the expected error range, the following issues may occur:

- If the calibration of VSR is high, there is a convergence issue that could lead to an increase in power consumption.
- Low VSR (near the VMIN) could lead to platform instability.

Convergence verification requires the following steps, with at least one sample on the customer product with customer software:

1. Set the device to the desired OPP (for more information, see Section 3.10.4.3, *Changing OPP*.
2. Enable the SmartReflex in the SRCONFIG[11] SRENABLE register.
3. Wait for the SmartReflex to converge.
4. Retrieve the required SmartReflex registers to verify that the error percentage (%error) per calculation is in the expected range.

NOTE: Convergence verification must be done in the listed sequence for each power rail and each OPP.

The following registers exist for each power rail; the appropriate register must be used:

1. The following registers must be retrieved after SmartReflex has converged to verify that the convergence is within the expected range:
   - SR.SENVAL
   - SR.NVALUERECIPROCAL
   - SR.ERRCONFIG
2. The following calculations are used to verify that the obtained voltage is converged:

(a) Extract the following values from the listed registers:
NCOUNT:

- COUNT of SENP = SR.SENVAL[31:16] SENPVAL
- COUNT of SENN = SR.SENVAL[15:0] SENNVAL

TARGET:

$$\text{TARGET OF SENP} = \frac{2^{[\text{hex2dec(SR.NVALUERECIPROCAL[23:20] SENPGAIN + 8)}]}}{\text{hex2dec(SR.NVALUERECIPROCAL[15:8] SENPRN)}}$$

prcm-100

$$\text{TARGET OF SENN} = \frac{2^{[\text{hex2dec(SR.NVALUERECIPROCAL[19:16] SENNGAIN + 8)}]}}{\text{hex2dec(SR.NVALUERECIPROCAL[7:0] SENNRN)}}$$

prcm-101

ERRMINLIMIT:

- ERRMINLIMIT = SR.ERRCONFIG[7:0] ERRMINLIMIT

ERRMAXLIMIT:

- ERRMAXLIMIT = SR.ERRCONFIG[15:8] ERRMAXLIMIT

(b) Calculate %error:

$$\text{SENP\%error} = \frac{\text{TARGET of SENP} - \text{COUNT of SENP}}{\text{TARGET of SENP}}$$

prcm-102

$$\text{SENN\%error} = \frac{\text{TARGET of SENN} - \text{COUNT of SENN}}{\text{TARGET of SENN}}$$

prcm-103

- %error = max(SENP%error, SENN%error)

NOTE: To be successfully converged, %error must be within the follwing range:
ERRMINLIMIN < %error < ERRMAXLIMIT

NOTE: If the %error is not within the expected range, check the SmartReflex parameters that are used in customer software.

3.8.3.2.5 Status Register

The status register (SRSTATUS) indicates the validity of the minimum/maximum/average and error generator output values.

SRSTATUS has the following bits and bit fields:

- SMARTREFLEXn.SRSTATUS[3] AVGERRVALID: Indicates the validity of the value in the SMARTREFLEXn.SENERROR_REG[15:8] AVGERROR bit field. When the value is 0, the average error is not valid. When the value is 1, the average error is within 2 percent of the valid average error.
- SMARTREFLEXn.SRSTATUS[2] MINMAXAVGVALID: Indicates the validity of the following registers:
  - SMARTREFLEXn.SENVAL
  - SMARTREFLEXn.SENMIN
  - SMARTREFLEXn.SENMAX
  - SMARTREFLEXn.SENAVG
  - SMARTREFLEXn.LVTSENVAL
  - SMARTREFLEXn.LVTSENMIN

  - SMARTREFLEXn.LVTSENMAX
  - SMARTREFLEXn.LVTSENAVG

  When the value is 0, the registers are not valid. When the value is 1, the registers contain valid values, although the values are not necessarily fully accumulated.
- SMARTREFLEXn.SRSTATUS[1] ERRGEN_VALID: Indicates the validity of the value in the SMARTREFLEXn.SENERROR_REG[7:0] SENERROR bit field. When the value is 0, the error value is invalid. When the value is 1, the error value is valid.
- SMARTREFLEXn.SRSTATUS[0] MINMAXAVGACCUMVALID: Indicates that the following registers contain their final values accumulated over the defined sample time period:
  - SMARTREFLEXn.SENVAL
  - SMARTREFLEXn.SENMIN
  - SMARTREFLEXn.SENMAX
  - SMARTREFLEXn.SENAVG
  - SMARTREFLEXn.LVTSENVAL
  - SMARTREFLEXn.LVTSENMIN
  - SMARTREFLEXn.LVTSENMAX
  - SMARTREFLEXn.LVTSENAVG

3.8.3.2.6 SmartReflex Parameters Set After Silicon Characterization

Certain parameters of the SmartReflex module are characterized and calibrated after silicon testing. These values are then provided separately. Users must configure these parameters according to their given values to ensure correct functioning of the module.

The values for the following parameters (explained in Section 3.8.3.2.3, *SmartReflex Submodules*) are set in the control module after device silicon characterization:

- SMARTREFLEXn.NVALUERECIPROCAL[23:20] SENPGAIN
- SMARTREFLEXn.NVALUERECIPROCAL[19:16] SENNGAIN
- SMARTREFLEXn.NVALUERECIPROCAL[15:8] SENPRN
- SMARTREFLEXn.NVALUERECIPROCAL[7:0] SENNRN
- SMARTREFLEXn.LVTNVALUERECIPROCAL[23:20] SENPGAIN
- SMARTREFLEXn.LVTNVALUERECIPROCAL[19:16] SENNGAIN
- SMARTREFLEXn.LVTNVALUERECIPROCAL[15:8] SENPRN
- SMARTREFLEXn.LVTNVALUERECIPROCAL[7:0] SENNRN

The value of these parameters must be read from the corresponding registers of the control module.

Information about the following parameters of the SmartReflex module is provided after silicon characterization:

- SMARTREFLEXn.AVGWEIGHT_REG[3:2] SENPAVGWEIGHT
- SMARTREFLEXn.AVGWEIGHT_REG[1:0] SENNAVGWEIGHT
- SMARTREFLEXn.ERRCONFIG[18:16] ERRWEIGHT
- SMARTREFLEXn.ERRCONFIG[15:8] ERRMAXLIMIT
- SMARTREFLEXn.ERRCONFIG[7:0] ERRMINLIMIT

The recommended values for the ERRCONFIG register bit fields are:

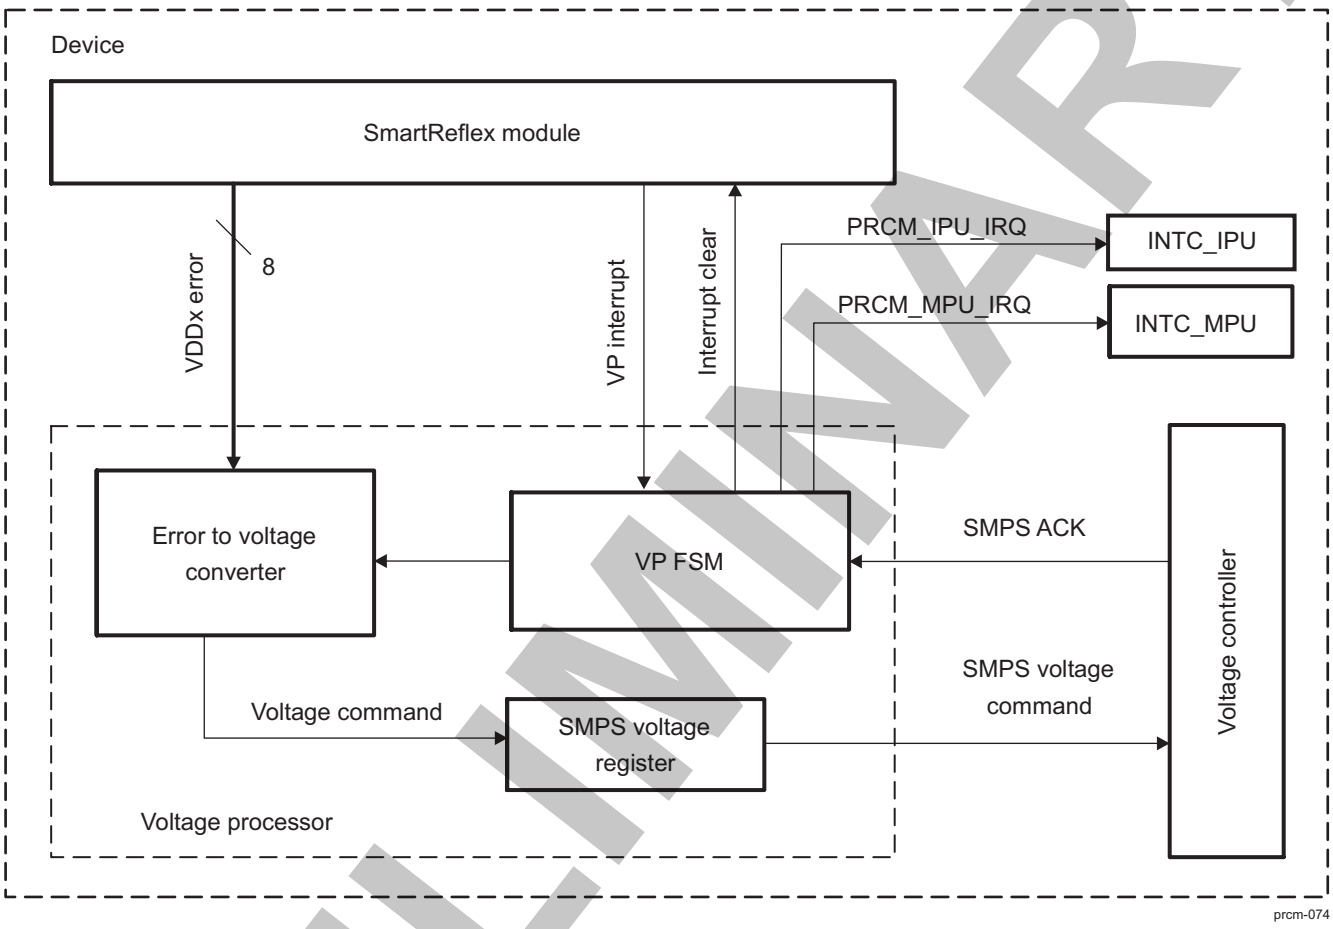
- ERRCONFIG[18:16] ERRWEIGHT: Recommended value is 0x4 (1280 µs)
- ERRCONFIG[15:8] ERRMAXLIMIT: Recommended value is 0x2 (1.60%)
- ERRCONFIG[7:0] ERRMINLIMIT: Recommended values are OPP and technology-dependent. Initial development values are:
  - 0xF4 (–9.6%) for OPP_LOW
  - 0xF9 (–5.6%) for OPP_NOM

– 0xFA (–4.0%) for OPP_HIGH

3.8.3.2.7 Voltage Processor Module

Figure 3-80 is a functional overview of the voltage processor.

Figure 3-80. Voltage Processor Functional Overview



The voltage processor receives an error value and a VP interrupt signal from the SmartReflex module. Each time a new error value is sent, the SmartReflex module triggers an interrupt to inform the voltage processor. The voltage processor consists of an error-to-voltage command converter and a state controller. It processes an error and sends a voltage command to the voltage controller. It receives an acknowledge signal from the voltage controller when the SMPS receives the command. The voltage processor then acknowledges the SmartReflex module by clearing its interrupt.

The voltage processor is enabled by the PRM_VP_n_CONFIG[0] VPENABLE bit.

Voltage Processor Interrupts

The voltage processor uses the PRM_IPU_IRQ (IPU_IRQ_47 of INTC_IPU) interrupt line of the IPU and PRM_MPU_IRQ (MPU_IRQ_11 of INTC_MPU) interrupt line of the MPU. They can be enabled through PRM_IRQENABLE_IPU and PRM_IRQENABLE_MPU registers. Table 3-302 and Table 3-303 list the interrupt events in the voltage processor module and their enable and status bits.

Table 3-302. Voltage Processor Interrupt Events

Interrupt Type	Description
Transaction done	Voltage processor transaction is complete.
Equal value	Voltage requested in the new voltage command is the same as the current SMPS voltage.

Table 3-302. Voltage Processor Interrupt Events (continued)

Interrupt Type	Description
No SMPS acknowledge	SMPS has not responded in a defined time interval to the transmitted voltage command.
Maximum VDD	New voltage requested in the voltage command is equal to or greater than maximum VDD.
Minimum VDD	New voltage requested in the voltage command is equal to or less than minimum VDD.
OPP change done	The average error is within the desired limit.

NOTE: Transaction done and OPP change done interrupt events are generated under the same conditions (after voltage change).

Table 3-303. Voltage Processor Interrupt Event Enable and Status Bits

Interrupt Type	Enable Bit	Status Bit
Transaction done	PRM_IRQENABLE_IPU[21] VP_CORE_TRANXDONE_EN	PRM_IRQSTATUS_IPU[21] VP_CORE_TRANXDONE_ST
	PRM_IRQENABLE_IPU[29] VP_MM_TRANXDONE_EN	PRM_IRQSTATUS_IPU[29] VP_MM_TRANXDONE_ST
Equal value	PRM_IRQENABLE_IPU[20] VP_CORE_EQVALUE_EN	PRM_IRQSTATUS_IPU[20] VP_CORE_EQVALUE_ST
	PRM_IRQENABLE_IPU[28] VP_MM_EQVALUE_EN	PRM_IRQSTATUS_IPU[28] VP_MM_EQVALUE_ST
No SMPS acknowledge	PRM_IRQENABLE_IPU[19] VP_CORE_NOSMPSACK_EN	PRM_IRQSTATUS_IPU[19] VP_CORE_NOSMPSACK_ST
	PRM_IRQENABLE_IPU[27] VP_MM_NOSMPSACK_EN	PRM_IRQSTATUS_IPU[27] VP_MM_NOSMPSACK_ST
Maximum VDD	PRM_IRQENABLE_IPU[18] VP_CORE_MAXVDD_EN	PRM_IRQSTATUS_IPU[18] VP_CORE_MAXVDD_ST
	PRM_IRQENABLE_IPU[26] VP_MM_MAXVDD_EN	PRM_IRQSTATUS_IPU[26] VP_MM_MAXVDD_ST
Minimum VDD	PRM_IRQENABLE_IPU[17] VP_CORE_MINVDD_EN	PRM_IRQSTATUS_IPU[17] VP_CORE_MINVDD_ST
	PRM_IRQENABLE_IPU[25] VP_MM_MINVDD_EN	PRM_IRQSTATUS_IPU[25] VP_MM_MINVDD_ST
OPP change done	PRM_IRQENABLE_IPU[16] VP_CORE_OPPCHANGEDONE_EN	PRM_IRQSTATUS_IPU[16] VP_CORE_OPPCHANGEDONE_ST
	PRM_IRQENABLE_IPU[24] VP_MM_OPPCHANGEDONE_EN	PRM_IRQSTATUS_IPU[24] VP_MM_OPPCHANGEDONE_ST
VP command acknowledged	PRM_IRQENABLE_IPU[22] VC_CORE_VPACK_EN	PRM_IRQSTATUS_IPU[22] VC_CORE_VPACK_ST
	PRM_IRQENABLE_IPU[30] VC_MM_VPACK_EN	PRM_IRQSTATUS_IPU[30] VC_MM_VPACK_ST

Voltage Processor Status

The status of the voltage processor is represented by the following:

Bits	Parameter	Description
PRCM module.PRM_VPn_VOLTAGE[7:0] VPVOLTAGE	Current voltage for SMPS	Value of the current voltage level requested by the voltage processor
PRCM module.PRM_VPn_STATUS[0] VPINIDLE	Voltage processor in INACTIVE state	The voltage processor is in idle mode.

Voltage Processor Parameters

The following parameters of the voltage processor must be configured:

Bits	Parameter	Description
PRCM.PRM_VPn_CONFIG[31:24] ERROROFFSET	Error offset	Error in voltage offset value
PRCM.PRM_VPn_CONFIG[23:16] ERRORGAIN	Error gain	Error in voltage gain value
PRCM.PRM_VPn_CONFIG[3] TIMEOUTEN	Time-out enable	Enables/disables the time-out set by the time-out delay parameter. 0: Time-out is disabled, VP FSM waits indefinitely. 1: Time-out is enabled. Time out will occurs when the programmed time-out value have elapsed.
PRCM.PRM_VPn_VSTEPMIN[7:0] VSTEPMIN	Minimum step size	Minimum voltage step size
PRCM.PRM_VPn_VSTEPMAX[7:0] VSTEPMAX	Maximum step size	Maximum voltage step size
PRCM.PRM_VPn_VLIMITTO[31:24] VDDMAX	Maximum VDD limit	Maximum voltage limit of the VDD. The VDDMAX registers are the maximum allowable voltage levels of the SMPS. This value is determined by the SMPS specification as well as the application specification. The upper bound on the SMPS voltage is VddMax.
PRCM.PRM_VPn_VLIMITTO[23:16] VDDMIN	Minimum VDD limit	Minimum voltage limit of the VDD. The VDDMIN registers are the minimum allowable voltage levels of the SMPS. This value is determined by the SMPS specification as well as the application specification. The lower bound on the SMPS voltage is VddMin.
PRCM.PRM_VPn_VLIMITTO[15:0] TIMEOUT	Time-out delay	Maximum delay between a voltage change command and its acknowledge. The TIMEOUT register determines the number of SYS_CLK cycles that the voltage controller state-machine will wait for the rising edge of SMPS VP_acknowledge, when PRCM.PRM_VPn_CONFIG[3] TIMEOUTEN = 1. If PRCM.PRM_VPn_CONFIG[3] TIMEOUTEN = 0, the loop will wait indefinitely.
PRCM.PRM_VPn_CONFIG[15:8] INITVDD	Initial VDD voltage	Initial voltage set in the voltage processor
PRCM.PRM_VPn_CONFIG[2] INITVDD	Initialize VDD	Set initial voltage given in initial VDD voltage parameter in the voltage processor
PRCM.PRM_VPn_VSTEPMIN[23:8] SMPSWAITTIMEMIN	Minimum SMPS wait time	Slew rate for negative voltage steps
PRCM.PRM_VPn_VSTEPMAX[28:8] SMPSWAITTIMEMAX	Maximum SMPS wait time	Slew rate for positive voltage steps
PRCM.PRM_VPn_CONFIG[1] FORCEUPDATE	Force update	Sends the value of the VP current voltage parameter as the new voltage command to SMPS

3.8.3.2.8 SMPS-Dependent Parameter Configuration

The values of the following parameters of the voltage processor module depend on the characteristics of the SMPS used:

- PRCM.PRM_VPn_CONFIG[31:24] ERROROFFSET
- PRCM.PRM_VPn_CONFIG[23:16] ERRORGAIN
- PRCM.PRM_VPn_VSTEPMIN[7:0] VSTEPMIN
- PRCM.PRM_VPn_VSTEPMAX[7:0] VSTEPMAX
- PRCM.PRM_VPn_VLIMITTO[31:24] VDDMAX
- PRCM.PRM_VPn_VLIMITTO[23:16] VDDMIN
- PRCM.PRM_VPn_VLIMITTO[15:0] TIMEOUT
- PRCM.PRM_VPn_VSTEPMIN[23:8] SMPSWAITTIMEMIN
- PRCM.PRM_VPn_VSTEPMAX[28:8] SMPSWAITTIMEMAX

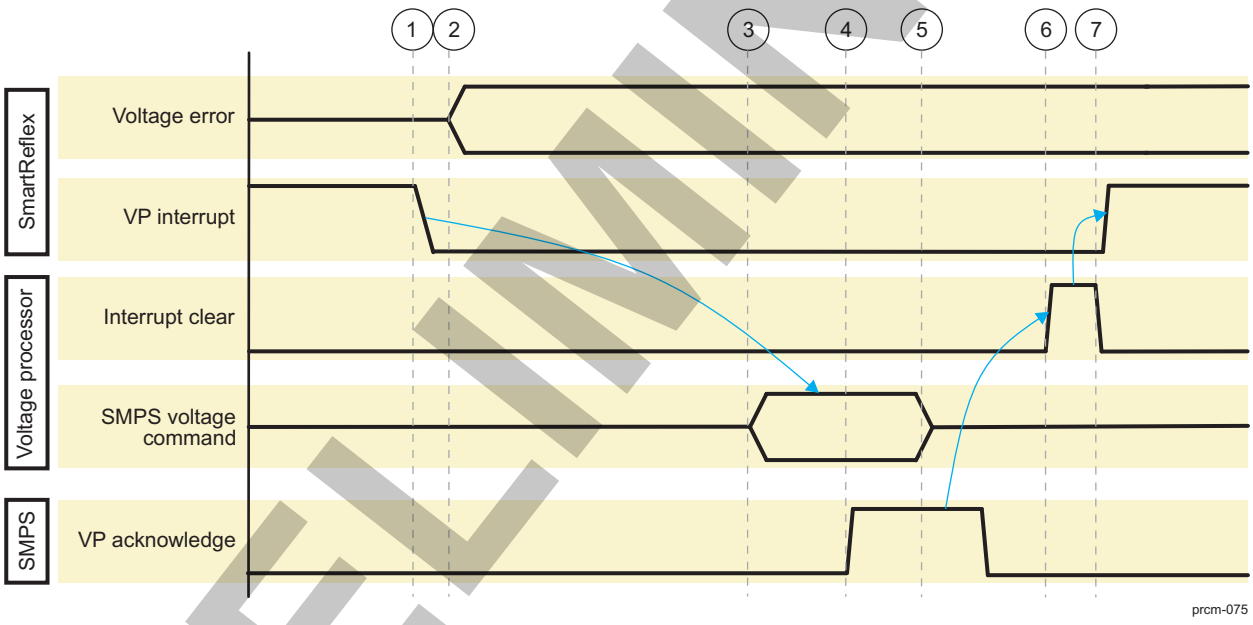
For information about the values of these parameters, see the specification document of the SMPS used.

3.8.3.2.9 Communication Between SmartReflex, Voltage Processor, Voltage Controller, and SMPS

The SmartReflex module, voltage processor, voltage controller, and SMPS implement a simple handshake protocol based on a request/acknowledge mechanism (see Figure 3-81):

1. The SmartReflex module generates a VP interrupt (clears to 0) when the average error crosses the minimum or maximum error bounds.
2. The average VDDx error is passed to the voltage processor when automatic voltage control is enabled.
3. The voltage processor reads the error and generates the voltage command for the SMPS. It then informs the voltage controller that a new voltage command is ready for the SMPS. The voltage controller sends the voltage command to the SMPS (external power IC) through the dedicated I^2C interface.
4. The SMPS responds to the reception of the voltage command with an acknowledgment to the voltage controller.
5. The voltage controller sends the acknowledgment to the voltage processor.
6. The voltage processor sends the interrupt-clear signal to the SmartReflex module.
7. The SmartReflex module clears the VP interrupt. It is now again ready to send a new frequency-error interrupt to the voltage processor.

Figure 3-81. SmartReflex – SMPS Communication for Automatic Voltage Adjustments



3.8.4 Internal LDOs Control

3.8.4.1 Memory LDOs

Embedded SRAM LDOs are used to supply power to the split-rail memory arrays. The PRM generates the controls used to select LDO operating mode: on-active, on-retention, or off.

Split-rail type SRAMs are used in the device to implement the larger memories. These SRAMs feature memory array and periphery logic, which are on separate supplies to allow independent power management. Proper memory operation, however, requires the SRAM array voltage never to be operated at a level lower than the SRAM periphery logic.

Memory LDO can switch to on, retention, and off modes:

- On (active) mode: 1.15 V is the normal voltage reference used through all functional OPPs whenever memories must be functional. When logic voltage level VDD_x_L (where x can be MPU, CORE, or MM) becomes higher than the associated memory voltage level VDD_x_M, the LDO operates in tracking mode and follows its respective VDD_x_M or VDD_x_ABB voltage level.

- Retention mode: 0.6 V is set when software allows and when all memory banks belonging to the LDO memory voltage are in RETENTION state. In this mode, the output voltage is generated from the corresponding VDD_WKUP_L logic voltage source.

Section 3.8.6.1, *Memory LDOs Transitions*, describes the state transition conditions and sequences for the memory LDOs.

NOTE: The voltage levels associated with the different modes may depend on the device characteristics.

3.8.4.2 WAKEUP LDOs

When the device enters its lower standby mode (named off mode), some logic blocks and memories remain supplied to allow restarting the device without needing to perform its full reinitialization: this is the wake-up voltage domain. This domain also includes most of the logic needed to perform the emulation and debug features. The lowest power consumption in standby mode is achieved by supplying the wake-up voltage domain only in off mode. To minimize power consumption at the platform level when the device is in this mode, all logic voltage supply regulators can be turned off, because the wake-up voltage domain is supplied by an embedded LDO using the 1.2-V I/O voltage supply on its input.

The WAKEUP LDO supports three voltage states, depending on the PD_WKUPAON and PD_EMU activity:

- EMULATION overdrive: The voltage level is 1.16 V, and the LDO is set in bypass mode. OPP_WKUP_EMULATION is reached as soon as emulation/debug is active, regardless of the device mode (standby, off, or on)
- ON: The voltage reference (default state) is 1.0 V. Other voltage domains are active or idle, emulation/debug is inactive.
- SLEEP: The voltage reference is 0.9 V. It is set when the device enters sleep mode. All other voltage domains are inactive or off, and emulation/debug is inactive.

Section 3.8.6.3, *VDD_WKUP_L Transitions,* describes the state transition conditions and sequences for the WAKEUP LDO.

NOTE: The voltage levels associated with the different modes may depend on the device characteristics.

At boot time, the WAKEUP LDO is started in emulation mode. It is a software command (that is, from OS or ROM code) to set it to a different mode.

3.8.4.3 ABB LDOs Control

The ABBLDO supports three voltage modes:

- Bypass mode: In this mode, the ABBLDO_x is bypassed and outputs the VDD_x_L voltages (x refers to the MPU and MM). This mode is activated when FBB is not required, or when the voltage domain enters low-power mode.
- FBB mode is enabled when the device is a weak process device at the highest OPP.

The PRCM module provides the PRM_ABBLDO_MPU_SETUP and PRM_ABBLDO_MM_SETUP registers for configuration with the following controls:

- SR2EN: To enable or bypass the ABB power management
- ACTIVE_FBB_SEL: To enable or bypass FBB mode
- SR2_WTCNT_VALUE: LDO settling delay on OPP change. The delay is in the number of system clock cycles.

The PRCM module provides the PRM_ABBLDO_MPU_CTRL and PRM_ABBLDO_MM_CTRL registers for control:

- OPP_SEL: Current operational OPP

- OPP_CHANGE: Initiate an OPP-based ABBLDO setting change
- SR2_STATUS: Current mode of operation of ABBLDO
- SR2_IN_TRANSITION: ABBLDO in transition

For the ABBLDO state-change programming sequence, see Section 3.10.4.3, *Changing OPP*.

3.8.4.4 BANDGAPsControl

BANDGAPs provides voltage reference for internal LDOs. The PRCM module automatically controls the switching between ON and OFF states of the BANDGAPs, based on the power state of the device. It is completely transparent to user software.

BANDGAPs startup time is 100 µs. The PRM_BANDGAP_SETUP[7:0] STARTUP_COUNT bit field must be set accordingly.

3.8.5 EMIF-Specific Interface

The PRCM module provides to the EMIF a special signal to increase the rate of incremental leveling during the voltage update. This signal is active when OPP changes during the voltage ramp of VD_CORE.

This signal is driven by hardware during the OPP change of VD_CORE, if it passes through the voltage processor (force update). It is controlled by software in case the OPP voltage change is done through VOLCON without passing through the voltage processor (bypass).

An override bit, PRM_VC_VAL_BYPASS[25] OPP_CHANGE_EMIF_LVL, is available. When this bit is set to 1, the special signal is forced to 1. When this bit is cleared to 0, the special signal is forced to 0 (if not driven to 1 by hardware).

3.8.6 Voltage Domain State Transitions

Section 3.1.1.3.1, *Voltage Domain*, describes the supported states of a voltage domain. This section describes the trigger conditions to enable and perform sleep and wake-up transitions on PRCM module-controlled voltage domains:

- VDD_MPU_L
- VDD_MM_L
- VDD_CORE_L
- VDD_MPU_M
- VDD_MM_M
- VDD_CORE_M

It also identifies state transition sequences for these voltage domains.

When the voltage domain state-transition control is set to automatic, the PRCM module initiates the voltage domain state transition when the required hardware conditions are satisfied. These hardware conditions can be based on the power domain state conditions and/or system clock state conditions. The PRCM module prevents any transition when the associated conditions are not satisfied.

The VDD_MPU_M, VDD_MM_M, or VDD_CORE_M memory voltage domain is automatically transitioned to the retention level whenever all memory arrays in the domain reach the RETENTION power state. Similarly, a transition back to ON power state is triggered upon one or more domain memory arrays requiring a transition back to ON power state.

If a voltage command acknowledgment is not received within an allowed response time window (communications error over the I^2C interface), an error status is logged, a global warm reset is generated, and the transition is skipped.

3.8.6.1 VDD_x_L Transitions

The transition trigger conditions for sleep transition from ON to SLEEP or RETENTION state are:

- Software setting: PRM_VOLTCTRL[a:b] AUTO_CTRL_VDD_<x>_L = SLEEP (0x1) or RETENTION (0x2)

- Power state conditions:
  - For voltage domain SLEEP state transition: All power domains in the voltage domain must be in the ON-INACTIVE or the RETENTION state.
  - For voltage domain RETENTION state transition: All power domains in the voltage domain must be in the RETENTION state.
  - VDD_MPU_L (MPU voltage domain) transition status can be check by reading bit PRM_VOLTST_MPU[20] INTRANSITION. VDD_MM_L (MM voltage domain) transition status can be checked by reading bit PRM_VOLTST_MM[20] INTRANSITION.
- Clock state conditions: No clock activity on voltage domain

NOTE:

- In case of VDD_CORE_L sleep transition from ON to SLEEP state, the PD_CORE can be only in ON-INACTIVE or RETENTION state.
- In case of VDD_MPU_L and VDD_MM_L sleep transition from ON to SLEEP state, the reference and bypass clocks to their respective DPLLs must also be gated.
- In both cases, upon completion of CORE voltage domain sleep transition, PRCM asserts COREAON_IO_SRCOMP_PWRDN signal. It waits for 8 SYS_CLK cycles then disables COREAON_IO_SRCOMP_GFCLK clock.

The transition trigger condition for a wake-up transition from SLEEP or RETENTION to ON state is:

- Any wake-up event occurs on the voltage domain.

The state transition sequence is:

1. All transition trigger conditions are met.
2. The voltage controller sends an ON, SLEEP, or RETENTION command sequence over the I^2C interface.
3. The PRCM module waits for an I^2C command sequence acknowledge.
4. The PRCM module starts the voltage transition counter.
5. When the counter expires, a voltage transition is complete.

NOTE: Upon completion of CORE voltage domain transition to ON from SLEEP or RET, PRCM enables COREAON_IO_SRCOMP_GFCLK clock. It waits for 8 SYS_CLK cycles then de-asserts COREAON_IO_SRCOMP_PWRDN signal.

3.8.6.2 Memory LDO Transitions

The transition trigger condition for on-to-retention mode is:

- At least one memory bank associated with the LDO is in RETENTION state and the rest of the memory banks are in RETENTION state.

The transition sequence is:

1. Transition trigger conditions are true (that is, satisfied).
2. Switch LDO reference to RETENTION mode value if on-to-retention mode transition.
3. Start counter for LDO stabilization.
4. When counter expires, voltage transition is complete.

3.8.6.3 VDD_WKUP_L Transitions

The ON-to-SLEEP transition trigger conditions are:

- Power domain states: Device is in low-power state (STANDBY state) and PD_EMU power domain is off.
- Clock states: Only the 32K clock is active in CD_WKUPAON (and the system clock is gated at the

SCRM level).

The SLEEP-to-ON transition trigger conditions are:

- Any device wake-up event other than emulation wake-up event

The EMULATION-to-ON transition trigger conditions are:

- Power domain states: PD_EMU is off and device is in active mode.
- Clock states: PD_EMU is off and any clock other than 32K clock is active in PD_WKUPAON.

The EMULATION-to-SLEEP transition trigger conditions are:

- Power domain states: Device is in low-power state (STANDBY state) and PD_EMU power domain is off.
- Clock states: Only the 32K clock is active in CD_WKUPAON (and the system clock is gated at the SCRM level)

The SLEEP or ON-to-EMULATION transition trigger condition is:

- Any wake-up event on PD_EMU

The transition sequence is:

1. Transition trigger conditions are met.
2. VDD_WKUP_L initiates the transition.
3. Starts a counter for VDD_WKUP_L transition.
4. VDD_WKUP_L transition completes.

3.8.7 DVFS

Dynamic voltage and frequency scaling is a technique that can be used on the logic voltage domains (VDD_MPU_L, VDD_MM_L, and VDD_CORE_L), independently of one another. Upon a current or predictive performance request, determined by software according to ad hoc algorithms or heuristics, software can configure the PRCM module to change the OPP of a voltage domain. For an increase in performance, the voltage is first raised, and then the frequency is increased. For a decrease in performance, the frequency is first decreased, and then the voltage is dropped.

3.8.7.1 EMIF Clock Frequency Scaling Constraints

CD_EMIF is inside PD_CORE. The EMIF subsystem receives the following clocks:

- L3 interface clock
- DLL clock (CORE_DLL_GCLK): for the DLL only
- EMIF_PHY_GCLK clock: Clock used to access the external memory DDR_PHY and to provide the EMIF functional clock. The EMIF functional clock is EMIF_PHY_GCLK divided by 2 inside the EMIF.

The L3 interface clock frequency can be changed on the fly without affecting EMIF operations if the CORE_DLL_GCLK and EMIF_PHY_GCLK clocks are not affected. The EMIF has an internal asynchronous bridge to handle different interface and functional clocks.

When the EMIF_PHY_GCLK clock frequency is to be changed, the EMIF must be put into IDLE state. This ensures that external memory is in self-refresh mode.

Similarly, a change in the DLL frequency implies that the DLL must relock. This can be done only when the EMIF is in IDLE state. Relock time is 250 DLL clock cycles.

The EMIF clocking scheme allows for a change of the OPP without a DLL relock (that is, the DLL is clocked by a relatively low frequency supported in all OPPs); then a change of the OPP consists only in changing the frequency of the EMIF_PHY_GCLK clock (and eventually the frequency of the L3 interface clock).

The EMIF clock control requirements in the PRCM module are:

- The EMIF clock frequency setting must be done through shadow registers for the CORE_DLL_GCLK and EMIF_PHY_GCLK clocks.
- The EMIF clock frequency update bit field must be used to copy the value of the shadow register as

the current value.

- The PRCM module hardware manages the following automatic EMIF clock-frequency update sequence:
  1. Put the EMIF into IDLE state.
  2. Upload shadow register values in the corresponding current register and wait for new EMIF clocks to be stable.
  3. Return the EMIF module to ACTIVE state.

NOTE: The PRCM module must not gate the CORE_DLL_GCLK and EMIF_PHY_GCLK clocks during automatic EMIF frequency change.

Programming model to perform automatic EMIF frequency change as part or not of an OPP change (DVFS). The automatic EMIF frequency change must always be performed while CD_EMIF is under software-forced wakeup (SW_WKUP).

VDD_CORE_L voltage fixed and only clock frequency switching

Changing the frequency of the EMIF clock without changing the voltage (example, change in the value of the SYS_CLK divider while DPLL_CORE is in bypass, change of DPLL_CORE mode between bypass and lock):

1. Software writes new EMIF timing parameters in the shadow registers of the EMIF.
2. Software configures the clock selection and frequency setting shadow registers in the PRCM module.
3. The PRCM module sends an IDLE request to the EMIF (overriding software settings of the MODULEMODE bit field for the EMIF).
4. The EMIF stalls transactions on internal interconnect, completes all committed transactions to external memory, and then puts the external memory in self-refresh mode.
5. The EMIF module then acknowledges the IDLE request of the PRCM module.
6. The PRCM module uploads the values configured in the shadow register bit fields to the corresponding current register bit fields.
7. The PRCM module waits for stabilization of the EMIF_PHY_GCLK and CORE_DLL_GCLK clocks through hardware monitoring, according to new settings.
8. The PRCM module requests the EMIF to exit idle (stops the overriding of software settings of the MODULEMODE bit field for the EMIF).
9. The PRCM module clears the frequency update field.
10. The EMIF copies the timing parameter configured in the shadow register as the current values.
11. The EMIF acknowledges that the PRCM module is functional, and starts accepting the transactions on the internal interconnect.
12. If the DLL clock was changed, the EMIF waits for the DLL to be relocked and for transactions on internal interconnect, if required. The PRCM module is not aware of the DLL operations.
13. Accesses to SDRAM are serviced again.

    Software execution can be stalled during the frequency change without harm as the critical hardware sequence is performed without software intervention. After setting the frequency update field, software must poll only for its clearing.

    Accesses to external SDRAM are stalled for the following duration:

- 2-µs maximum because EMIF is entering and exiting idle
- + 250 DLL clock cycles in case the DLL clock frequency has changed
- + DPLL lock time in case DPLL is locked

VDD_CORE_L voltage change for OPP switching

It is assumed that the frequency of the DLL clock is not changed and that the DPLL_CORE mode is not changed, and remains locked. Only the frequency of the EMIF_PHY_GCLK clock is changed using the post divider. The L3 clock is likely also to be changed, but it does not affect the EMIF.

Accesses to external SDRAM must be stalled for a maximum of 2 µs because of this sequence.

Voltage scaling up consists of:

1. Software indicates to the EMIF that a voltage change operation has started to allow the EMIF to ensure regular code updates from DLL masters.
2. Software disables SmartReflex for core voltage.
3. Software performs direct VD_CORE setting to new noncorrected value (for weak silicon) and waits for voltage stabilization.
4. Software configures SmartReflex for the corresponding OPP.
5. Software re-enables SmartReflex for core voltage.
6. Software indicates to the EMIF that the voltage change operation is complete and it does not need to control the code update from DLL masters directly.

3.8.7.2 GPMC Clock Frequency Scaling Constraints

CD_L3_MAIN2 is inside the PD_CORE. It supplies the L3MAIN2_L3_GICLK clock to the general-purpose memory controller (GPMC) module, which is used as an interface and functional clock. GPMC timing parameters are programmed at boot for the nominal OPP. These timing parameters can be used for lower L3 frequency, at the expense of slower access to external memory.

External memory connected to the GPMC may not support on-the-fly L3 frequency changes. The following is the sequence to perform L3 frequency change as part or not of an OPP change (DVFS):

- Hardware-controlled sequence:
  1. Software writes new L3 clock settings in the shadow register and sets the frequency update field.
  2. The PRCM module requests idle to the GPMC.
  3. The GPMC requests disconnection of its interconnect port and completes all outstanding transactions.
  4. The GPMC acknowledges idle. Any access to the GPMC is then stalled.
  5. The PRCM module uploads the values of the shadow register bit field in the corresponding current bit field.
  6. The PRCM module waits for stabilization of the L3 clocks by monitoring the DPLL_CORE clock and/or divider acknowledge signals according to new settings.
  7. The PRCM module clears the frequency update field.
  8. The PRCM module requests the GPMC to exit idle.
  9. The GPMC reallows interconnect connection and acknowledges it is functional.
  10. Accesses to external memory are serviced again.

NOTE:

- The frequency update field is the same as the one for the EMIF clock change. The same hardware in the PRCM module handles the frequency change of the L3, DDR_PHY, and DLL clocks.
- If the GPMC supports on-the-fly L3 frequency change, then the CM_SHADOW_FREQ_CONFIG2[0] GPMC_FREQ_UPDATE bit can allow bypassing of the sequence.

- Software-controlled sequence:
  1. Software configures the PRCM module to disable the GPMC.
  2. The PRCM module requests idle to the GPMC.
  3. The GPMC requests disconnection of its interconnect port and completes all outstanding transactions.
  4. The GPMC acknowledges idle. Any access to GPMC is then stalled.
  5. Software programs the PRCM module to change L3 frequency and wait for L3 stabilization.
  6. Software configures the PRCM module to reenable the GPMC.

7. The GPMC reallows interconnect connection and acknowledges it is functional.
8. Accesses to external memory are serviced again.

3.8.7.3 CORE DVFS Versus Subsystem Functionality

3.8.7.3.1 Display Subsystem

The display subsystem is part of the CORE voltage domain. It has internal FIFOs that are sized to sustain a change of OPP on the CORE voltage domain with no DPLL relock and no DLL frequency change. Accesses to external SDRAM are stalled for a maximum of 2 µs in these conditions. The display subsystem functional clock is not affected by the change of OPP on the CORE voltage domain. Therefore, the display subsystem supports on-the-fly DVFS of the CORE voltage domain, assuming the selected OPP remains compatible with the current display subsystem processing.

3.8.7.3.2 IVA

IVA is part of the MM voltage domain. It can sustain a temporary stall of external SDRAM accesses because it is not real-time processing. The IVA functional clock is not affected by the change of OPP on the CORE voltage domain; therefore, IVA supports on-the-fly DVFS of the CORE voltage domain.

3.8.7.3.3 Imaging Subsystem

The imaging subsystem (ISS) is part of the CORE voltage domain. It is real-time processing (or data flow). It cannot support a 2-µs stall of external SDRAM access, because of the heavy data throughput (FIFO size increase is prohibitive). As a consequence, the ISS does not support on-the-fly change of OPP on the CORE voltage domain. However, the CORE DVFS can be synchronized to the interframe idle window of the ISS. During this window, the ISS does not initiate a transaction to external SDRAM. The CORE OPP can be changed safely assuming the selected OPP remains compatible with the current ISS processing. The ISS functional clock frequency can remain unchanged or be scaled according to the OPP change, assuming it remains compatible with the current ISS processing. This is the responsibility of software.

Software performs the OPP change: OPP_LOW → OPP_NOM: The ISS/IPU primary functional clock is now running at 400 MHz, software sets the ISS clock divider to 4, and the ISS functional clock is back at 100 MHz.

3.9 Device Low-Power States

The device low-power states are the result of any valid combination of power domain states in which all the power domains are no longer in ACTIVE state. In such a situation the PRCM module hardware can trigger events to further lower the consumption of the device and the system.

Typically, the PRCM module can lower or even turn off the SMPS, shut down the system clock supplier, and allow the external power IC to turn off its internal resources.

These device low-power states are characterized by the system power consumption, wake-up latency, and required functionality.

The low-power states are:

- RETENTION: All logic voltage domains (VDD_MPU_L, VDD_MM_L, and VDD_CORE_L) are in RETENTION state.
- LOW POWER: Any combination of logic voltage domain states (SLEEP or RETENTION) other than those previously identified.

Once the PRCM module hardware detects any valid combination of power domain states, and if a proper programming model of the PRCM module is set, the PRCM module automatically triggers the transition into the device low-power mode.

3.9.1 Device Wake-Up Source Summary

Each power domain in the device may contain modules that can generate wake-up events. Modules in the other power domains require that their voltage domain be in RETENTION, SLEEP, or ON state to generate a wake-up event. Some modules may have a further constraint that their power domain must be in ON-INACTIVE or CSWR RETENTION state to generate a wake-up event.

The wake-up events can be asynchronous or synchronous. Synchronous wake-up events require the 32-kHz clock or the system clock to be active, while asynchronous wake-up events do not require an active clock.

The *Modules Attributes* subsection of each clock domain in Section 3.6, *Clock Management Functional Description*, describes the wake-up capability support for each module of the corresponding power domain.

While the device is in STANDBY mode, additional asynchronous wakeup events from other domains are able to wake up the device.

Table 3-304 identifies which modules in which power domains can be configured to generate a wake-up while the device is in a low-power mode.

Table 3-304. Wake-Up Sources During Device Low Power Mode

Device Power Mode	VDD_CORE state	VDD_MPU state	VDD_MM state	Domain able to generate wakeup	Wakeup source
STANDBY	Any combination of RET or SLEEP state			PD_ABE[1]	DMIC, McASP, WD_TIMER3
					McBSP1, McBSP2, McBSP3
					McPDM
				PD_CORE	IPU[2][3]
					DMA_SYSTEM[2][3]
					[1][4]
					GPIO2, GPIO3, GPIO4, GPIO5, GPIO6, GPIO7, GPIO8
					I2C1, I2C2, I2C3, I2C4, I2C5
					MCSPI1, MCSPI2, MCSPI3, MCSPI4
					MMC3, MMC4, MMC5
					UART1, UART2, UART3, UART4, UART5, UART6
				PD_L3_INIT[1]	MMC1, MMC2
					HSI[4], IEEE1500_2_OCP[3]
					SATA[4]
					USB_OTG_SS
					USB_HOST_HS, USB_TLL_HS
				PD_MPU	MPU[2][3]
				PD_DSP	DSP[2][3]
				PD_WKUPAON	GPIO1
					TIMER1, TIMER12
					PRM interrupt request towards MPU, IPU, or DSP
				PD_EMU	Any FORCEACTIVE directive
					Dynamic depedency towards L3_MAIN_2

(1) Only modules able to generate asynchronous wake-up have to be taken into account, and only when domain is in INACT or CSWRET state.
(2) True in every domain power state
(3) These modules have master wake-up (mwakeup) capability.
(4) These modules have both master wake-up and slave wake-up capability.

3.9.2 Device RETENTION State Management

In RETENTION state, the voltages to the device are lowered to their minimum value to retain only the logic build with RFFs, while all DFF logic is lost. The memory area may be retained, depending on the software configuration.

The device integrates enhanced device wake-up management while in RETENTION state. This allows:

- Triggering wakeup with limited capabilities from almost all programmed input pads around the device

- Triggering wakeup with full capabilities by using few GPIO inputs in the PD_WKUPAON power domain

The logic voltages VDD_CORE_L, VDD_MPU_L, and VDD_MM_L can transition to their retention value independently. Once the voltage domain state transition conditions are met in compliance with the software configuration, the PRCM module hardware initiates the transition into RETENTION state by sending an I^2C command for the corresponding SMPS.

When all the logic voltages are transitioned to their RETENTION state, the PRCM module hardware can, depending on a software configuration, toggle its system clock request and/or its power request to allow the SCRM to shut down the system clock source and to request the external power IC to shut down internal resources.

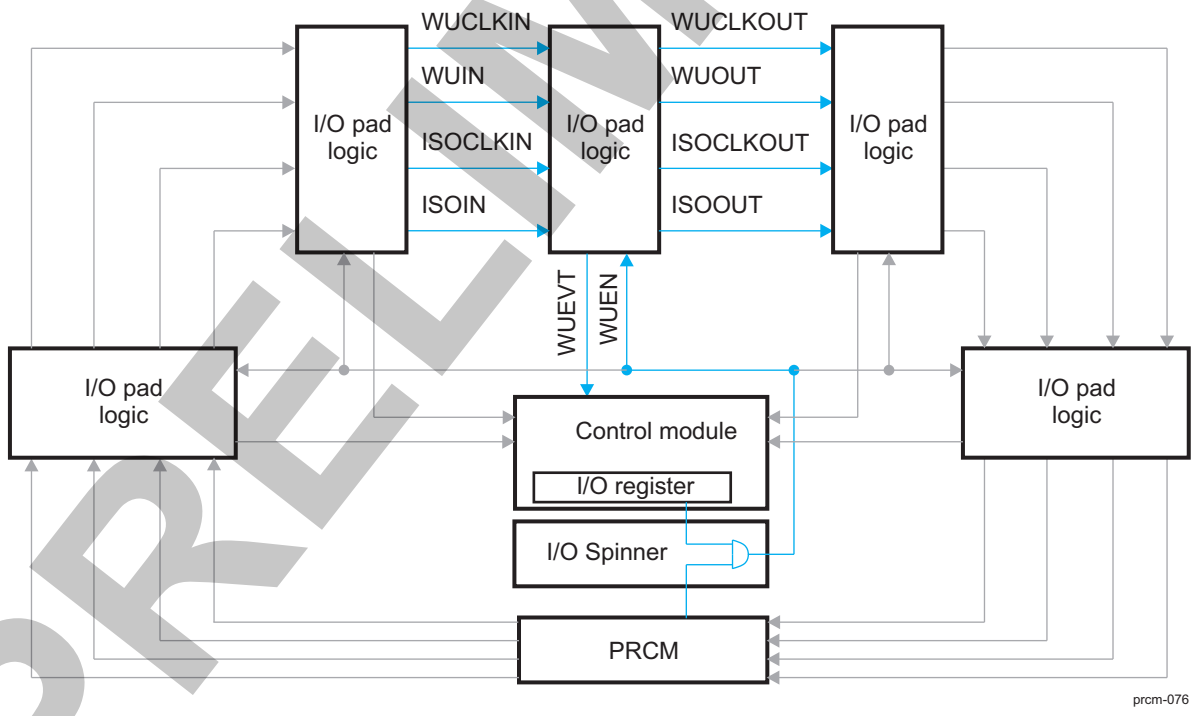
The PRCM module, SCRM, and the external power IC can also be programmed so that the voltage VDD_CORE_L is managed by the power request signal. This means:

- The power IC manages the ramp-down and ramp-up time of the VDD_CORE_L SMPS when the power request is toggled.
- The SCRM accounts for the overall setup of the PMIC resources (internal PMIC resources and VDD_CORE_L SMPS).
- The PRCM module sends RETENTION and ON commands through the I^2C interface. The value of the RETENTION voltage must be equal to the value of the current voltage, and the value of the ON voltage must be set to the expected voltage value following the wakeup. Also, the setup time periods corresponding to the SMPS ramp up and ramp down must be set to 0.

3.9.3 I/O Management

Figure 3-82 is an overview of the power-management modules and their internal connections with a generic power domain.

Figure 3-82. I/O Pads Daisy-Chain Configuration



The I/O pad logic at the two ends of the chain is connected to the PRM.

The I/O pad wake-up scheme must be enabled (WUEN signal) globally by setting the PRM_IO_PMCTRL[16] GLOBAL_WUEN bit and by also setting the I/O pad wake-up enabled/disabled individually (WUEN signal) by writing to the following bits in the control module:

- CONTROL.CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y[14] X_WAKEUPENABLE

- CONTROL.CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y[30] Y_WAKEUPENABLE

Once configured, the wake-up scheme within each I/O pad is enabled and disabled by triggering a control (WUCLKIN signal) of the I/O daisy chain. This is done through the PRM_IO_PMCTRL[8] WUCLK_CTRL bit. Software must enable the I/O wakeup before entering low-power mode and must disable it following a wake-up event.

Setting the PRM_IO_PMCTRL[8] WUCLK_CTRL bit to 1 asserts the WUCLKIN signal high to reset spurious wake-up event and to latch the current pad input value. The PRM_IO_PMCTRL[9] WUCLK_STATUS bit logs the WUCLKOUT signal of the last pad of the I/O ring. When this status is set to 1, software can clear the PRM_IO_PMCTRL[8] WUCLK_CTRL bit to effectively enable or disable the wake-up feature within each pad.

Additionally, it is required that WUCLKIN is forced to 1 during global POR. The I/O wake-up feature is enabled or disabled depending on a control (WUEN) for each I/O pad. This control is generated by the SPINNER logic resulting from the combination of a local enable/disable bit per pad in the control module and a global enable/disable bit in the PRCM module (that is, the PRM_IO_PMCTRL[16] GLOBAL_WUEN bit).

When a wake-up event is detected by a wakeup-enabled I/O pad in the daisy chain, it is logged within the I/O and is conveyed to the system control module (WUEVT signal). All the I/O wake-up event statuses are mapped on memory-mapped registers in the system control module.

When the device wakes up, the MPU can determine all sources of the current wake-up event logged into the following corresponding bits in the control module:

- CONTROL.CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y[15] X_WAKEUPEVENT
- CONTROL.CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y[31] Y_WAKEUPEVENT

For information about the control module, see Chapter 18, *Control Module*.

3.9.3.1 Hardware-Controlled I/O Isolation Sequences

I/Os have two buffers: 1.2 V and 1.8 V.

The software configuration determines whether the 1.2-V buffer or the 1.8-V buffer is used.

3.9.3.2 Software-Controlled I/O Isolation

In addition to the hardware-controlled I/O transitions, the PRM_IO_PMCTRL[0] ISOCLK_OVERRIDE bit can be used by software to force the ISOCLKIN signal to the I/O pad. It is then propagated from one pad to the other in the wake-up enabled daisy chain of I/Os. The PRM_IO_PMCTRL[1] ISOCLK_STATUS bit logs the ISOCLKOUT signal of the last pad of the I/O daisy chain.

NOTE: Override must be used at boot time only when software must change the mode of an I/O from 1.8-V default mode to 1.2-V mode. When not overridden, this signal is controlled only by hardware.

The PRM_IO_PMCTRL[4] ISOOVR_EXTEND bit allows extending the non-EMIF I/O isolation. This feature can be used by software to restore modules driving output, such as GPIO, while non-EMIF I/Os are still isolated. Once software completes the relevant module restore, it clears the bit and hardware performs full-isolation-to-EMIF on the hardware-controlled I/O transition.

The PRM_IO_PMCTRL[5] IO_ON_STATUS bit is available for software to check completion of the EMIF on transition.

3.10 PRCM Module Programming Guide

3.10.1 DPLLs Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and use of the module.

3.10.1.1 Global Initialization

3.10.1.1.1 Surrounding Module Global Initialization

This section identifies the requirements for initializing the surrounding modules when the module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DPLLs.

Table 3-305 describes the global initialization of the surrounding modules.

Table 3-305. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	Ensure that the DPLL reference clock (gated version of system clock) is active.

3.10.1.1.2 DPLL Global Initialization

3.10.1.1.2.1 Main Sequence – DPLL Global Initialization

This procedure initializes the DPLL after a POR or software reset and then locks it to the desired synthesized clock frequency.

Table 3-306. DPLL Global Initialization

Step	Register/Bit Field/Programming Model	Value
Configure SSC parameters.	See Section 3.10.1.1.2.2.	
Configure recalibration parameters.	See Section 3.10.1.1.2.3.	
Set DPLL automatic idle mode.	CM_AUTOIDLE_<DPLL name>[2:0] AUTO_DPLL_MODE	xx(1)
Configure synthesized clock parameters.	See Section 3.10.1.1.2.4.	
Configure output clocks parameters.	See Section 3.10.1.1.2.5.	
Lock DPLL.	CM_CLKMODE_<DPLL name>[2:0] DPLL_EN	0x7

(1) It depends on the desired auto idle mode. See Section 3.6.3.3.3, *DPLL Power Modes*.

3.10.1.1.2.2 Subsequence – SSC Parameter Configuration

This procedure configures the SSC parameters for the DPLL and enables the SSC feature.

Table 3-307. DPLL SSC Parameter Configuration

Step	Register/Bit Field/Programming Model	Value
Configure M Step Size.	CM_SSC_DELTAMSTEP_<DPLL name>[19:0] DELTAMSTEP	xx(1)
Configure modulation frequency divider exponent part.	CM_SSC_MODFREQDIV_<DPLL name>[10:8] MODFREQDIV_EXPONENT	xx(1)
Configure modulation frequency divider mantissa part.	CM_SSC_MODFREQDIV_<DPLL name>[6:0] MODFREQDIV_MANTISSA	xx(1)
Enable/disable frequency downspread.	CM_CLKMODE_<DPLL name>[14] DPLL_SSC_DOWNSPREAD	xx(2)

(1) See the SSC description in Section 3.6.3.3.5, *DPLL Spread Spectrum Clocking*.
(2) The selected value depends on the desired SSC feature settings.

Table 3-307. DPLL SSC Parameter Configuration (continued)

Step	Register/Bit Field/Programming Model	Value
Enable SSC feature.	CM_CLKMODE_<DPLL name>[12] DPLL_SSC_EN	0x1
Wait until SSC start acknowledge.	CM_CLKMODE_<DPLL name>[13] DPLL_SSC_ACK	0x1

3.10.1.1.2.3 Subsequence – Recalibration Parameter Configuration

This procedure enables the recalibration feature and the associated processor interrupt flag.

Table 3-308. DPLL Recalibration Parameter Configuration

Step	Register/Bit Field/Programming Model	Value
Clear recalibration interrupt status.	PRM_IRQSTATUS _<Processor name>[x] <DPLL name>_RECAL_ST	0x0
Unmask recalibration interrupt flag.	PRM_IRQENABLE _<Processor name>[x] <DPLL name>_RECAL_EN	0x1
Enable recalibration feature.	CM_CLKMODE_<DPLL name>[8] DPLL_DRIFTGUARD_EN	0x1

3.10.1.1.2.4 Subsequence – Synthesized Clock Parameter Configuration

This procedure configures the settings for the synthesized clock of the DPLL.

Table 3-309. DPLL Synthesized Clock Parameter Configuration

Step	Register/Bit Field/Programming Model	Value
Set DPLL clock synthesis multiplier.	CM_CLKSEL_<DPLL name>[18:8] DPLL_MULT	xx(1)
Set DPLL clock synthesis divider.	CM_CLKSEL_<DPLL name>[6:0] DPLL_DIV	xx(1)
IF : Low-power mode operation conditions satisfied?	Software test condition. See Section 3.6.3.3.2.	
Enable DPLL low-power operation mode.	CM_CLKMODE_<DPLL name>[10] DPLL_LPMODE_EN	0x1
ENDIF		

(1) It depends on the desired synthesized clock frequency. See Section 3.6.3.3, *Generic DPLL Overview*.

3.10.1.1.2.5 Subsequence – Output Clock Parameter Configuration

This procedure configures the settings for the output clocks of the DPLL.

Table 3-310. DPLL Output Clock Parameter Configuration

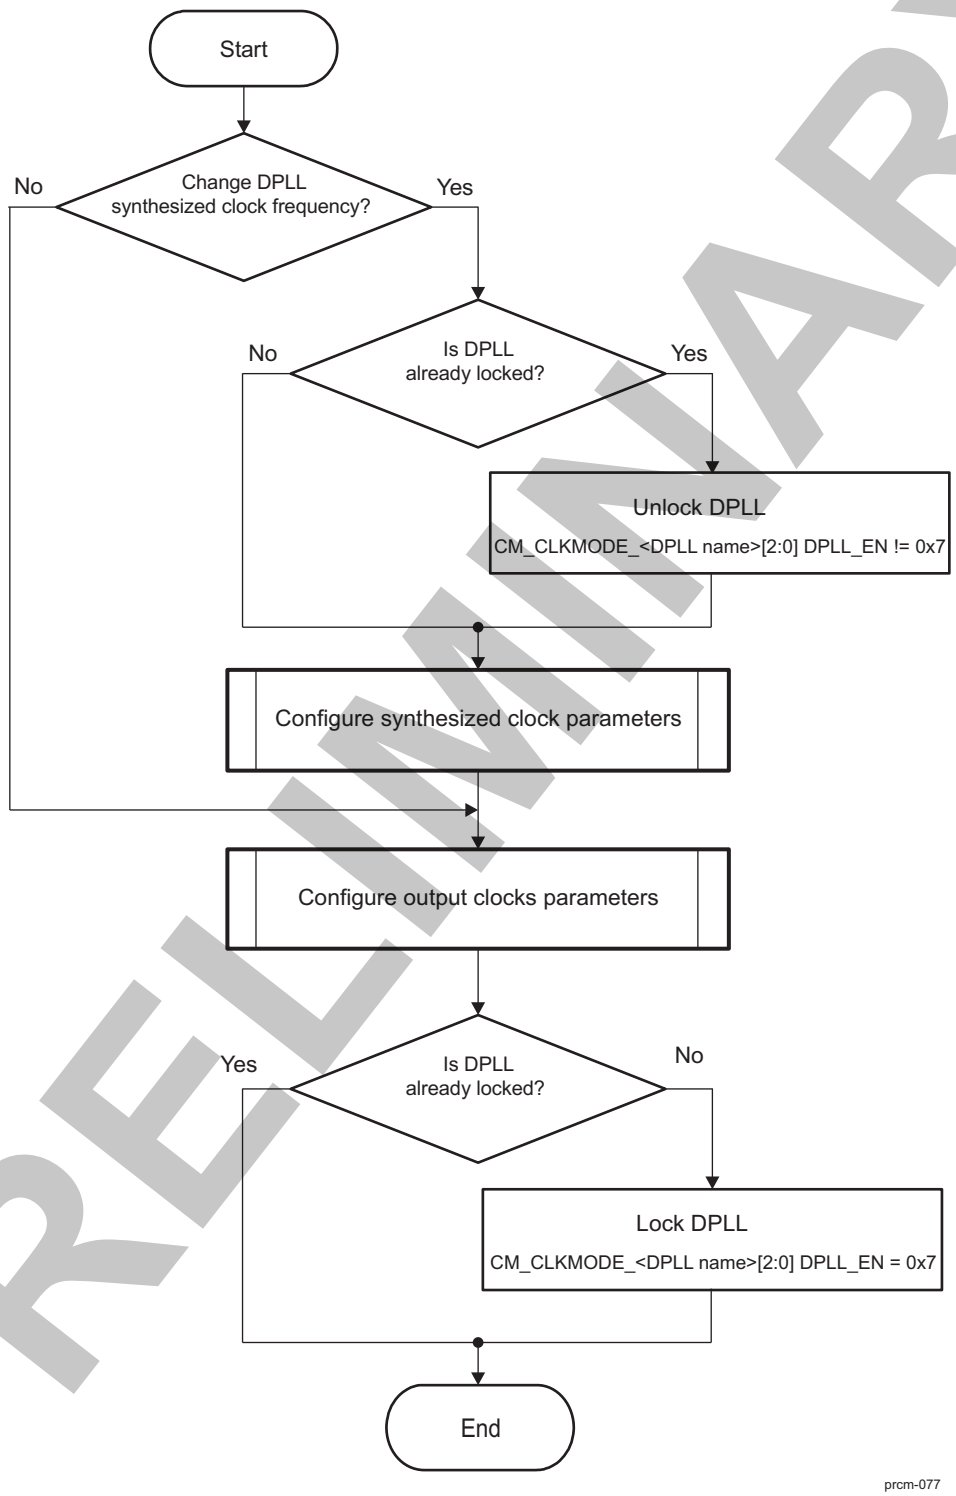
Step	Register/Bit Field/Programming Model	Value
Set output clock dividers (that is, M2, M3, and Hmn), where m is 1 or 2, and n is from 1 to 4. It depends on the available clock output of the DPLL.	CM_DIV_M2_<DPLL name>[4:0] DIVHS CM_DIV_M3_<DPLL name>[4:0] DIVHS CM_DIV_Hmn_<DPLL name>[5:0] DIVHS	xx(1)

(1) It depends on the desired output clock frequency. See Section 3.6.3.3, *Generic DPLL Overview*.

3.10.1.2 DPLL Output Frequency Change

Figure 3-83 shows the DPLL output-frequency change.

Figure 3-83. DPLL Output-Frequency Change



To unlock a DPLL, a mode different from the Lock Mode (0x7) should be programmed in the CM_CLKMODE_<DPLL NAME>[2:0] DPLL_EN bit field. The modes that can be programmed in the DPLL_EN bit field and can unlock the DPLL are:

- For type A DPLLs: Idle Low Power bypass mode (0x5) and Idle Fast Relock bypass mode (0x6)
- For type B DPLLs: Low Power Stop mode (0x1) and Idle Low Power bypass mode (0x5)

Table 3-311 and Table 3-312 summarize register and subprocess call sequences for DPLL output frequency changes.

Table 3-311. Register Call Summary for Sequence – DPLL Output Frequency Change

Register Name
CM_CLKMODE_DPLL name

Table 3-312. Subprocess Call Summary for Sequence – DPLL Output Frequency Change

Subprocess Name	Cross-Reference
Configure synthesized clock parameters.	See Section 3.10.1.1.2.4.
Configure output clocks parameters.	See Section 3.10.1.1.2.5.

3.10.2 Clock Management Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and use of the clocks in the device.

3.10.2.1 Global Initialization

3.10.2.1.1 Surrounding Module Global Initialization

This section identifies the requirements for initializing the surrounding modules when the module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DPLLs.

Table 3-313 describes the global initialization of the surrounding modules.

Table 3-313. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM DPLLs	Ensure that the DPLLS managed by the PRCM module are initialized.

3.10.2.1.2 Clock Management Global Initialization

3.10.2.1.2.1 Main Sequence – Clock Domain Global Initialization

This procedure initializes the clock domain of the device after a POR or software reset.

Table 3-314. Clock Domain Global Initialization

Step	Register/Bit Field/Programming Model	Value
Configure module clock-management feature of master modules in the clock domain.	<Module name>_SYSCONFIG[x] MIDLEMODE <Module name>_SYSCONFIG[x] STANDBYMODE	xx(1)
Configure module clock-management feature of slave modules in the clock domain.	See Section 3.10.3.3.	
Enable/disable static sleep dependency with other clock domains (that is, destination clock domains). Not all dependencies are configurable.	CM_<Clock Domain name>_STATICDEP[x] <Destination Clock Domain name>_STATDEP	0x0: Disable 0x1: Enable
Set dynamic dependency window size.	CM_<Clock Domain name>_DYNAMICDEP[27:24] WINDOWSIZE	xx(2)

(1) See the module register for valid modes.
(2) It depends on the desired size of the window. See Section 3.1.1.1.7.2, *Clock Domain Dependency*.

Table 3-314. Clock Domain Global Initialization (continued)

Step	Register/Bit Field/Programming Model	Value
Enable/disable module wake-up dependency for the modules of the clock domain. It is available when the module can generate an interrupt or a DMA request to a service provider module (for example, a processor or DMA).	PM_<Clock Domain name>_<Module name>_WKDEP[x] WKUPDEP_<Module name>_<DMA/IRQ reques>t_<DMA/Processor name>	0x0: Disable 0x1: Enable
Set clock domain state transition feature.	CM_<Clock Domain name>_CLKSTCTRL[1:0] CLKTRCTRL	xx(3)

(3) It depends on the desired state of the clock domain. See Table 3-11.

3.10.2.1.2.2 Subsequence – Slave Module Clock-Management Parameters Configuration

This procedure configures the SSC parameters for the DPLL and enables the SSC feature.

Table 3-315. Slave Module Clock-Management Parameter Configuration

Step	Register/Bit Field/Programming Model	Value
Configure module idle mode feature.	<Module name>_SYSCONFIG[x] SIDLEMODE <Module name>_SYSCONFIG[x] IDLEMODE	xx(1)
IF : Smart-idle mode is selected	<Module name>_SYSCONFIG[x] SIDLEMODE <Module name>_SYSCONFIG[x] IDLEMODE	0x10
Configure module clock requirement feature.	<Module name>_SYSCONFIG[x] CLOCKACTIVITY	x(1)
ENDIF		
Configure module management behavior on the PRCM module side.	CM_<Clock Domain name>_<Module name>_CLKCTRL[1:0] MODULEMODE	xx(2)

(1) See the module register for valid settings.
(2) The selected value depends on the desired clock-management behavior.

3.10.2.2 Clock Domain Sleep Transition and Troubleshooting

This procedure initiates a sleep transition on a clock domain and allows debugging if the transition does not occur.

Table 3-316. Clock Domain Sleep Transition and Troubleshooting

Step	Register/Bit Field/Programming Model	Value
Set clock domain sleep transition state.	CM_<Clock Domain name>_CLKSTCTRL[1:0] CLKTRCTRL	0x1: SW_SLEEP 0x3: HW_AUTO
IF : Clock domain sleep transition not initiated?		
Check that all clock domain master modules are in standby mode.	CM_<Clock Domain name>_<Module name>_CLKCTRL[18] STBYST	0x1: Module in standby
Check that all clock domain slave modules are in idle mode.	CM_<Clock Domain name>_<Module name>_CLKCTRL[17:16] IDLEST	0x1: In transition 0x2: Interface clock idled 0x3: Module idled
ENDIF		

3.10.2.3 Enable/Disable Software-Programmable Static Dependency

To change the setting of a software-programmable static dependency, use the procedure described in Table 3-317.

Table 3-317. Enable/Disable Software-Programmable Static Dependency

Step	Register/Bit Field/Programming Model	Value
Force destination domain to be awake (SW_WKUP).	CM_<Dest_CDname>_CLKSTCTRL[1:0] CLKTRCTRL	0x2

Table 3-317. Enable/Disable Software-Programmable Static Dependency (continued)

Step	Register/Bit Field/Programming Model	Value
Wait until power domain that encloses the destination domain is ON.	PM_<Dest_PDname>_PWRSTST	=0x3
Change the static dependency.	CM_<Src_CDname>_STATICDEP[x] Dest_CDname_STATDEP	0x1
Put destination domain back to automatic transition (HW_AUTO).	CM_<Dest_CDname> _CLKSTCTRL[1:0] CLKTRCTRL	0x3

3.10.3 Power Management Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and control of the power domain in the device.

3.10.3.1 Global Initialization

3.10.3.1.1 Surrounding Module Global Initialization

Initialization of any surrounding modules within the device is not required. The external power IC and the device clocks should be active.

3.10.3.1.2 Power Management Global Initialization

3.10.3.1.2.1 Main Sequence – Power Domain Global Initialization and Setting

This procedure initializes the power domain of the device after a POR or software reset.

Table 3-318. Power Domain Global Initialization

Step	Register/Bit Field/Programming Model	Value
Configure memory area power state when the power domain is on. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_ONSTATE	0x1: RETAINED 0x3: ON
Configure memory area power state when the power domain transitions to RETENTION state. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_RETSTATE	0x1: RETAINED
Configure logic area RETENTION power state when the power domain transitions to RETENTION state.	PM_<Power Domain name>_PWRSTCTRL[2] LOGICRETSTATE	0x1: CSWR
Select target power state of the power domain. Not all states are programmable.	PM_<Power Domain name>_PWRSTCTRL[1:0] POWERSTATE	0x1: RETENTION 0x2: ON-INACTIVE 0x3: ON-ACTIVE
Wait until power state change is complete.	PM_<Power Domain name>_PWRSTST[1:0] POWERSTATEST	0x1: RETENTION 0x2: ON-INACTIVE 0x3: ON-ACTIVE

3.10.3.2 Forced Memory Area State Change With Power Domain ON

This procedure initiates a forced memory area state change while the power domain is ON.

Table 3-319. Forced Memory Area State Change With Power Domain ON

Step	Register/Bit Field/Programming Model	Value
Configure memory area target power state. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_ONSTATE	0x1: RETAINED 0x3: ON
Get memory area current state.	PM_<Power Domain name>_PWRSTST[x] <Memory Bank name>_STATEST	0x1: RETAINED 0x3: ON

3.10.3.3 Forced Power Domain Low-Power State Transition

This procedure initiates a power state transition on a power domain from current low-power state (ON-INACTIVE or RETENTION) to a lower power state (RETENTION).

Table 3-320. Forced Power Domain Low-Power State Transition

Step	Register/Bit Field/Programming Model	Value
Select target low-power state of the power domain. Not all states are programmable.	PM_<Power Domain name>_PWRSTCTRL[1:0] POWERSTATE	0x1: RETENTION
Force power domain low-power state transition.	PM_<Power Domain name>_PWRSTCTRL[4] LOWPOWERSTATECHANGE	0x1: Force change
Wait until state change is complete.	PM_<Power Domain name>_PWRSTCTRL[4] LOWPOWERSTATECHANGE	0x0: Change complete
Get current power state.	PM_<Power Domain name>_PWRSTST[1:0] POWERSTATEST	0x1: RETENTION

3.10.4 Voltage Management Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and management of the voltage domains of the device.

3.10.4.1 Global Initialization

3.10.4.1.1 Surrounding Module Global Initialization

Initialization of any surrounding modules within the device is not required. The external power IC and the device clocks should be active.

3.10.4.1.2 Voltage Management Global Initialization

3.10.4.1.2.1 Main Sequence – Voltage Management Global Initialization and Setting

This procedure initializes the voltage management framework in the device.

Table 3-321. Power Domain Global Initialization

Step	Register/Bit Field/Programming Model	Value
Initialize SmartReflex modules.	See Section 3.10.4.1.3.	
Initialize voltage processor modules.	See Section 3.10.4.1.4.	
Initialize voltage controller module.	See Section 3.10.4.1.5.	

3.10.4.1.3 SmartReflex Module Initialization

This procedure initializes the SmartReflex module.

Table 3-322. SmartReflex Module Configuration

Step	Register/Bit Field/Programming Model	Value
Configure clock.	See Section 3.10.4.1.3.1.	
Configure sensor.	See Section 3.10.4.1.3.2.	
Configure accumulator and minimum/maximum/average.	See Section 3.10.4.1.3.3.	
Configure error generator.	See Section 3.10.4.1.3.4.	
Configure interrupt generator.	See Section 3.10.4.1.3.5.	
Enable module.	SMARTREFLEXn.SRCONFIG[11] SRENABLE	0x1

3.10.4.1.3.1 Subsequence – Clock Configuration

This procedure configures the clock for the SmartReflex module.

Table 3-323. SmartReflex Module Clock Configuration

Step	Register/Bit Field/Programming Model	Value
Configure desired clock frequency.	SMARTREFLEXn.SRCONFIG[21:12] SRCLKLENGTH	xx(1)
Configure desired idle mode.	SMARTREFLEXn.ERRCONFIG[25:24] IDLEMODE	0x0: Forced-idle 0x1: No-idle 0x2: Smart-idle 0x3: Smart-idle wakeup
Enable/disable wake-up feature.	SMARTREFLEXn.ERRCONFIG[26] WAKEUPENABLE	0x0: Disable 0x1: Enable
Enable clock.	CM_COREAON_ SMARTREFLEX_<SR name>_CLKCTRL[1:0] MODULEMODE	0x2: Enable

(1) See Equation 1 for clock frequency calculation.

3.10.4.1.3.2 Subsequence – Sensors Configuration

This procedure configures the sensors in the SmartReflex module.

Table 3-324. SmartReflex Module Sensors Configuration

Step	Register/Bit Field/Programming Model	Value
Enable SVT sensor core N.	SMARTREFLEXn.SRCONFIG[1] SENNENABLE	0x1
Enable SVT sensor core P.	SMARTREFLEXn.SRCONFIG[0] SENPENABLE	0x1
Enable SVT sensor core.	SMARTREFLEXn.SRCONFIG[10] SENENABLE	0x1
Enable LVT sensor core N.	SMARTREFLEXn.SRCONFIG[3] LVTSENNENABLE	0x1
Enable LVT sensor core P.	SMARTREFLEXn.SRCONFIG[2] LVTSENPENABLE	0x1
Enable LVT sensor core.	SMARTREFLEXn.SRCONFIG[4] LVTSENENABLE	0x1

3.10.4.1.3.3 Subsequence – Accumulator and Min/Max/Avg Configuration

This procedure configures the accumulator and minimum/maximum/average part of the SmartReflex module.

Table 3-325. Accumulator and Minimum/Maximum/Average Configuration

Step	Register/Bit Field/Programming Model	Value
Set size of the accumulator.	SMARTREFLEXn.SRCONFIG[31:22] ACCUMDATA	xxx(1)
Set average weight parameter for sensor A.	SMARTREFLEXn.AVGWEIGHT_REG[1:0] SENNAVGWEIGHT	x(1)
Set average weight parameter for sensor B.	SMARTREFLEXn.AVGWEIGHT_REG[3:2] SENPAVGWEIGHT	x(1)
Enable minimum/maximum/average.	SMARTREFLEXn.SRCONFIG[8] MINMAXAVGENABLE	0x1

(1) These parameters are calculated as given in Section 3.8.3.2.3, *SmartReflex Submodules*.

3.10.4.1.3.4 Subsequence – Error Generator Configuration

This procedure configures the error generator part of the SmartReflex module.

Table 3-326. Error Generator Configuration

Step	Register/Bit Field/Programming Model	Value
Configure four reference value parameters for SVT sensor core.	SMARTREFLEXn.NVALUERECIPROCAL[23:20] SENPGAIN	x[1]
	SMARTREFLEXn.NVALUERECIPROCAL[19:16] SENNGAIN	x[1]
	SMARTREFLEXn.NVALUERECIPROCAL[15:8] SENPRN	xx[1]
	SMARTREFLEXn.NVALUERECIPROCAL[7:0] SENNRN	xx[1]
Configure four reference value parameters for LVT sensor core.	SMARTREFLEXn.LVTNVALUERECIPROCAL[23:20] SENPGAIN	x[1]
	SMARTREFLEXn.LVTNVALUERECIPROCAL[19:16] SENNGAIN	x[1]
	SMARTREFLEXn.LVTNVALUERECIPROCAL[15:8] SENPRN	xx[1]
	SMARTREFLEXn.LVTNVALUERECIPROCAL[7:0] SENNRN	xx[1]
Enable the error generator.	SMARTREFLEXn.SRCONFIG[9] ERRORGENERATORENABLE	0x1

(1) Configured according to the values read for the current operating voltage level from the control module register in Section 3.8.3.2.3, *SmartReflex Submodules*.

3.10.4.1.3.5 Subsequence – Interrupt Generator Configuration

This procedure configures the interrupt generator part of the SmartReflex module.

Table 3-327. Interrupt Generator Configuration

Step	Register/Bit Field/Programming Model	Value
Set the four reference value parameters.	SMARTREFLEXn.ERRCONFIG[18:16] ERRWEIGHT	x
	SMARTREFLEXn.ERRCONFIG[15:8] ERRMAXLIMIT	xx
	SMARTREFLEXn.ERRCONFIG[7:0] ERRMINLIMIT	xx
IF : Automatic voltage control using voltage processor	Software test condition	
Clear voltage processor bounds interrupt status.	SMARTREFLEXn.ERRCONFIG[23] VPBOUNDSINTSTATENA	0x1
Unmask voltage processor bounds interrupt.	SMARTREFLEXn.ERRCONFIG[22] VPBOUNDSINTENABLE	0x1
ELSE-IF : Software-controlled voltage management	Software test condition	
Unmask <processor> interrupt events.	SMARTREFLEXn.IRQENABLE_SET[3] MCUACCUMINTENASET	0x1
	SMARTREFLEXn.IRQENABLE_SET[2] MCUVALIDINTENASET	0x1
	SMARTREFLEXn.IRQENABLE_SET[1] MCUBOUNDSINTENASET	0x1
ENDIF		

3.10.4.1.4 Voltage Processor Initialization

This procedure initializes the voltage processor.

Table 3-328. Voltage Processor Module Initialization

Step	Register/Bit Field/Programming Model	Value
Configure error-to-voltage converter.	See Section 3.10.4.1.4.1.	
Configure PRCM module.	See Section 3.10.4.1.4.2.	
Mask/unmask interrupt events.	PRCM.PRM_IRQENABLE_<Processor name>	
Enable module.	PRCM.PRM_<Voltage Processor name>_CONFIG[0] VPENABLE	0x1

3.10.4.1.4.1 Subsequence – Error-to-Voltage Converter Configuration

This procedure configures the error-to-voltage converter of the voltage processor.

Table 3-329. Error-to-Voltage Converter Configuration

Step	Register/Bit Field/Programming Model	Value
Set error offset. Offset value in the Error to Voltage converter (8-bit signed two's complement number)(1). The default value for ERROROFFSET is zero.	PRCM.PRM_<Voltage Processor name>_CONFIG[31:24] ERROROFFSET	xx(2)
Set error gain. Gain value in the Error to Voltage converter (8-bit signed two's complement number). ERRORGAIN = ((Error2voltageGAIN(3))*100/SMPSstepsize)	PRCM.PRM_<Voltage Processor name>_CONFIG[23:16] ERRORGAIN	xx(2)
Set SMPS negative voltage step slew rate (in number of cycles per SMPS step).	PRCM.PRM_<Voltage Processor name>_VSTEPMIN[23:8] SMPSWAITTIMEMIN	xx(2)
Set SMPS minimum voltage (VDD) step size. 0 ≤ ΔVdd(4) ≤ VStepMin	PRCM.PRM_<Voltage Processor name>_VSTEPMIN[7:0] VSTEPMIN	xx(2)
Set SMPS positive voltage step slew rate (in number of cycles per SMPS step).	PRCM.PRM_<Voltage Processor name>_VSTEPMAX[23:8] SMPSWAITTIMEMAX	xx(2)
Set SMPS maximum voltage (VDD) step size. ΔVDD(4) > VStepMax	PRCM.PRM_<Voltage Processor name>_VSTEPMAX[7:0] VSTEPMAX	xx(2)
Set SMPS minimum voltage level.	PRCM.PRM_<Voltage Processor name>_VLIMITTO[23:16] VDDMIN	xx(2)
Set SMPS maximum voltage level.	PRCM.PRM_<Voltage Processor name>_VLIMITTO[31:24] VDDMAX	xx(2)

(1) ErrorOffset is an 8-bit two's complement signed frequency error and adding 1-bit is equivalent to adding 0.79% to the frequency error.
(2) Depends on the characteristics of the SMPS
(3) Recommended value for Error2voltage gain is approximately 0.004V/% error.
(4) ΔVdd = (FreqError + ErrorOffset) * Error2VoltageGain. FreqError is a two complement value fixed-point fraction, MSB is a signed bit.

3.10.4.1.4.2 Subsequence – FSM Configuration

This procedure configures the FSM of the voltage processor.

Table 3-330. FSM Configuration

Step	Register/Bit Field/Programming Model	Value
Set maximum length of time to wait for the command acknowledge from the SMPS.	PRCM.PRM_<Voltage Processor name>_VLIMITTO[15:0] TIMEOUT	xxxx(1)
Set target initial voltage level of the SMPS.	PRCM.PRM_<Voltage Processor name>_CONFIG[15:8] INITVOLTAGE	xx
Assert the initial voltage into the voltage processor FSM.	PRCM.PRM_<Voltage Processor name>_CONFIG[2] INITVDD	0x1

(1) Depends on the characteristics of the SMPS

3.10.4.1.5 Voltage Controller Initialization

This procedure initializes the voltage controller.

Table 3-331. Voltage Controller Module Initialization

Step	Register/Bit Field/Programming Model	Value
Configure external power IC device I^2C slave addresses. 7 bits for each SMPS IC: [20:14] SMPS2, [13:7] SMPS1, [6:0] SMPS0.	PRCM.PRM_VC_SMPS_<Memory Volatge Domain>_CONFIG[6:0] SA_<Voltage Domain name>	xx(1)
Configure voltage configuration register addresses for the VDD channels. Voltage values – 8 bits for each SMPS IC: [23:16] SMPS2, [15:8] SMPS1, [7:0] SMPS0..	PRCM.PRM_VC_SMPS_<Memory Volatge Domain>_CONFIG[15:8] VOLRA_<Voltage Domain name>	xx(1)
Configure command configuration register addresses. Command (ON/ON-Low-Power/Retention). Command values – 8 bits for each SMPS IC: [23:16] SMPS2, [15:8] SMPS1, [7:0] SMPS0.	PRCM.PRM_VC_SMPS_<Memory Volatge Domain>_CONFIG[23:16] CMDRA_<Voltage Domain name>	xx(1) (2)
Configure voltage domain command values. ON/ON-Low-Power/Retention, command values are 8 bits for each channel.	PRCM.PRM_VC_VAL_CMD_<Voltage Domain name>[x] <Command name>	xx(1)
Configure pointers for the VDD channels.	See Section 3.10.4.1.5.1.	
Configure I^2C interface.	See Section 3.10.4.1.5.2.	

(1) Depends on the connectivity characteristics of the external SMPS device. For more information, see the corresponding SMPS reference documents.

(2) Second register address values are useful when the SMPS ICs have different configuration registers to switch ON or OFF, then VDD voltage configuration register.

3.10.4.1.5.1 Subsequence – VDD Channel Pointer Configuration

This procedure configures the FSM of the voltage processor.

Table 3-332. VDD Channel Pointer Configuration

Step	Register/Bit Field/Programming Model	Value
Set slave address pointer for each VDD channel (1 bit per VDD channel) – (0) VDD0, (1) VDD1, (2) VDD2.	PRCM.PRM_VC_SMPS_<Memory Voltage Domain>_CONFIG[24] SEL_SA_<Voltage Domain name>	
Set voltage configuration register address pointer for each VDD channel (1 bit per VDD channel) – (0) VDD0, (1) VDD1, (2)VDD2.	PRCM.PRM_VC_SMPS_<Memory Voltage Domain>_CONFIG[25] RAV_<Voltage Domain name>	
Set command (ON/Retention) configuration register address pointer for each VDD channel (1 bit per VDD channel) – (0) VDD0, (1) VDD1, (2) VDD2.	PRCM.PRM_VC_SMPS_<Memory Voltage Domain>_CONFIG[26] RAC_<Voltage Domain name>	
Select voltage or command configuration register for FSM commands. Enables bits for PIREGSCHRAC usage (1 bit per VDD channel) – (0) VDD0, (1) VDD1, (2) VDD2.	PRCM.PRM_VC_SMPS_<Memory Voltage Domain>_CONFIG[27] RACEN_<Voltage Domain name>	
Set command voltage level selection pointer. ON/ONLP/RET voltage values set selection for each VDD channel (1 bit per VDD channel) (2) VDD2, (1) VDD1, (0) VDD0.	PRCM.PRM_VC_SMPS_<Memory Voltage Domain>_CONFIG[28] CMD_<Voltage Domain name>	

3.10.4.1.5.2 Subsequence – I^2C Configuration

This procedure configures the I^2C in the voltage controller.

Table 3-333. I²C Configuration

Step	Register/Bit Field/Programming Model	Value
Enable/disable I²C bus double digital filter.	PRCM.PRM_VC_CFG_I2C_MODE[6] DFILTEREN	
Set master code value for I²C HS preamble.	PRCM.PRM_VC_CFG_I2C_MODE[2:0] HSMCODE	
Enable/disable I²C HS mode.	PRCM.PRM_VC_CFG_I2C_MODE[3] HSMODEEN	0x0: Disable 0x1: Enable
Enable/disable repeated start operation.	PRCM.PRM_VC_CFG_I2C_MODE[4] SRMODEEN	0x0: Disable 0x1: Enable

3.10.4.2 Disable Sequence for AVS (SmartReflex) and VP

3.10.4.2.1 Disable the Error Generator Module

This procedure disables the Error Genarator Module.

Table 3-334. Disable the Error Generator

Step	Register/Bit Field/Programming Model	Value
Disable the VP BOUND IRQ (1)	SMARTREFLEXn.ERRCONFIG[22] VPBOUNDSINTENABLE	0x0
Disable sensors	SMARTREFLEXn.SRCONFIG[10] SENENABLE	
Disable the Error Generator module	SMARTREFLEXn.SRCONFIG[9] ERRORGENERATORENABLE	

(1) At this stage, it is important to not write 0x1 on bit SMARTREFLEXn.ERRCONFIG[23] VPBOUNDSINTSTATENA

3.10.4.2.2 Disable the Voltage Processor

This procedure disables the Voltage Processor.

Table 3-335. Disable the Voltage Processor

Step	Register/Bit Field/Programming Model	Value
Disable the VP module	PRCM.PRM_<Voltage_Processor_name>_CONFIG[0] VPENABLE	0x0
Wait for VP being idled by pooling bit VPINIDLE to 0x1	PRCM.PRM_<Voltage_Processor_name>_STATUS[0] VPINIDLE	==0x1

3.10.4.2.3 Disable AVS (SmartReflex)

This procedure disables the Adaptive Voltage Scaling (AVS).

Table 3-336. Disable the SmartReflex Module

Step	Register/Bit Field/Programming Model	Value
Enable the MPU Disable Acknowledge IRQ	SMARTREFLEXn. IRQENABLE_SET[0] MCUDISABLEACTINTENASET	0x1
Disable the SmartReflex module	SMARTREFLEXn. SRCONFIG[11] SRENABLE	0x0
Clear the VP BOUND IRQ status bit only if it is set	SMARTREFLEXn. ERRCONFIG[23] VPBOUNDSINTSTATENA	0x1
Disable the following MPU IRQs or at least check these IRQs are not enabled: ACCUM IRQ, VALID IRQ and BOUND IRQ	SMARTREFLEXn. IRQENABLE_CLR[3] MCUACCUMINTENACLR SMARTREFLEXn. IRQENABLE_CLR[2] MCUVALIDINTENACLR SMARTREFLEXn. IRQENABLE_CLR[1] MCUBOUNDSINTENACLR	0x1
Clear the following MPU IRQ statuses: ACCUM IRQ, VALID IRQ and BOUND IRQ	SMARTREFLEXn. IRQSTATUS[3] MCUACCUMINTSTATENA SMARTREFLEXn. IRQSTATUS[2] MCUVALIDINTSTATENA SMARTREFLEXn. IRQSTATUS[1] MCUBOUNDSINTSTATENA	0x1

Table 3-336. Disable the SmartReflex Module (continued)

Step	Register/Bit Field/Programming Model	Value
Wait for the MPU Disable Acknowledge IRQ	SMARTREFLEXn. IRQSTATUS[0] MCUDISABLEACKINTSTATENA	==0x1
Clear the MPU Disable Acknowledge IRQ status	SMARTREFLEXn. IRQSTATUS[0] MCUDISABLEACKINTSTATENA	0x1
Disable the MPU Disable Acknowledge IRQ status	SMARTREFLEXn. IRQENABLE_CLR[0] MCUDISABLEACKINTENACLR	0x1

3.10.4.3 Changing OPP

This procedure allows changing of the voltage of the external SMPS from one OPP to the other. It also covers the programming sequence for ABBLDO if the OPP change requires a change in state of the ABBLDO.

NOTE: When switching from the current OPP to a target OPP, if the clock frequency of the target OPP is less than that of the current OPP, the clock frequency is first switched to the lower frequency of the target OPP, and only then is voltage scaling initiated. However, if the clock frequency of the target OPP is greater than that of the current OPP, voltage scaling is initiated before frequency scaling.

In Table 3-337 and Table 3-338, "xxx" denotes MPU or MM.

Table 3-337. Transition From Nominal/Slow OPP to Fast OPP

Step ID	Step Description	Register/Register Bit Field/Programming Model	Value
1	Disable the SmartReflex module.	SMARTREFLEXn.SRCONFIG[11] SRENABLE and/or [10] SENENABLE	0x0
2	Mask SmartReflex interrupts		
3	Disable the voltage processor module	PRCM.PRM_<Voltage_Processor_Name>_CONFIG[0] VPENABLE	0x0
4	Set the new OPP – Fast OPP	PRCM.PRM_ABBLDO_xxx_CTRL[1:0] OPP_SEL	0x1
5	Set the voltage processor with new voltage level	PRCM.PRM_VP_xxx_CONFIG[15:8] INITVOLTAGE	
6	Triggers a write of the value in the INITVOLTAGE into the voltage processor	PRCM.PRM_<Voltage_Processor_Name>_CONFIG[2] INITVDD	0x1
7	Force update of the SMPS. This command is sent from the Voltage Processor to the Voltage controller. The Voltage controller sends the new voltage to the power IC via the I^2C Interface. In response the Power IC returns the "SMPS ACK" acknowledge signal to the Voltage controller via the I^2C interface.	PRCM.PRM_VP_xxx_CONFIG[1] FORCEUPDATE	0x1
8	The "SMPS ACK" response is then transmitted to the Voltage processor which will start the counter ForceUpdateWait.	PRCM.PRM_VP_xxx_VOLTAGE[31:8] FORCEUPDATEWAIT	
9	When ForceUpdateWait counter expires, VP_xxx_TRANXDONE_ST interrupt status is set.	PRM_IRQSTATUS_MPU and PRM_IRQSTATUS_MPU_2	0x1

Table 3-337. Transition From Nominal/Slow OPP to Fast OPP (continued)

10	Initiate the state change for the ABB LDO	PRCM.PRM_ABBLDO_xxx_CTRL[2] OPP_CHANGE	0x1
11	ABB LDO performs its transition from bypass mode to FBB mode. The transition is complete when SR2_WTCNT_VALUE counter expires. When this counter expires, OPP_CHANGE bit is set to 0 and ABB_xxx_DONE_ST interrupt status is set.	PRCM.PRM_ABBLDO_xxx_SETUP PRCM.PRM_ABBLDO_xxx_CTRL PRM_IRQSTATUS_MPU PRM_IRQSTATUS_MPU_2	
12	Re-enable the SmartReflex module and interrupts	SMARTREFLEXn.SRCONFIG[11] SR_EN	0x1
13	Re-enable the voltage processor (via I^2C commands sent through the voltage controller)		

Table 3-338. Transition From Fast OPP to Nominal OPP

Step ID	Step Description	Register/Register Bit Field/Programming Model	Value
1	Disable the SmartReflex module.	SMARTREFLEXn.SRCONFIG[11] SRENABLE and/or [10] SENENABLE	0x0
2	Mask SmartReflex interrupts		
3	Disable the voltage processor module	PRCM.PRM_<Voltage_Processor_Name>_CONFIG[0] VPENABLE	0x0
4	Set the new OPP – Nominal OPP	PRM_ABBLDO_xxx_CTRL[1:0] OPP_SEL	0x2
5	Initiate the state change for the ABB LDO	PRM_ABBLDO_xxx_CTRL[2] OPP_CHANGE	0x1
6	ABB LDO performs its transition from FBB mode to bypass mode. The transition is complete when PRM_ABBLDO_xxx_SETUP. sr2_wtcnt_value counter expires. When this counter expires, OPP_CHANGE bit is set to 0 and ABB_xxx_DONE_ST interrupt status is set.	PRM_ABBLDO_xxx_SETUP PRM_ABBLDO_xxx_CTRL PRM_IRQSTATUS_MPU PRM_IRQSTATUS_MPU_2	
7	Set the voltage processor with new voltage level.	PRCM.PRM_<Voltage_Processor_Name>_CONFIG[15:8] INITVOLTAGE	
8	Triggers a write of the value in the INITVOLTAGE into the voltage processor	PRCM.PRM_<Voltage_Processor_Name>_CONFIG[2] INITVDD	0x1
9	Force update of the SMPS. This command is sent from the Voltage Processor to the Voltage controller. The Voltage controller sends the new voltage to the power IC via the I^2C Interface. In response the Power IC returns the "SMPS ACK" acknowledge signal to the Voltage controller via the I^2C interface.	PRM_VP_xxx_CONFIG[1] FORCEUPDATE	0x1
10	The "SMPS ACK" response is then transmitted to the Voltage processor which will start the counter ForceUpdateWait.	PRM_VP_xxx_VOLTAGE[31:8] FORCEUPDATEWAIT	
11	When ForceUpdateWait counter expires, VP_xxx_TRANXDONE_ST interrupt status is set.	PRM_IRQSTATUS_MPU and PRM_IRQSTATUS_MPU_2	0x1

Table 3-338. Transition From Fast OPP to Nominal OPP (continued)

12	Re-enable the SmartReflex module and interrupts	SRn.SRCONFIG[11] SR_EN	0x1
13	Re-enable the voltage processor (via I^2C commands sent through the voltage controller)		

When the SMPS ACK is received from the I^2C interface, this ACK signal sets the PRM_IRQSTATUS_MPU/PRM_IRQSTATUS_IPU[14] VC_BYPASS_ST interrupt status. When this interrupt is received, the software starts a counter. At the end of the counter, the VDD_xxx.L supply has reached its final state. Software must set the PRM_ABBLDO_xx_CTRL[2] OPP_CHANGE bit to initiate the state change for the ABB LDO. ABB LDO performs its transition from FBB mode to bypass mode. The transition is complete when the PRM_ABBLDO_xxx_SETUP[15:8] SR2_WTCNT_VALUE counter expires. When this counter expires, the PRM_ABBLDO_xxx_CTRL[2] OPP_CHANGE bit is set to 0, and the status of the ABB_xxx_DONE_ST interrupt is set.

3.11 PRCM Register Manual

3.11.1 PRM Instance Summary

Table 3-339. PRM Instance Summary

Module Name	Base Address	Size
OCP_SOCKET_PRM	0x4AE0 6000	256 bytes
CKGEN_PRM	0x4AE0 6100	256 bytes
MPU_PRM	0x4AE0 6300	256 bytes

Bits	Field Name	Description	Type	Reset
31	ABB_MM_DONE_ST	MM ABB mode change done. This status is set when OPP_CHANGE bit is cleared by hardware in PRM_ABBLDO_MM_CRTL register. It is cleared by SW. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
30	VC_MM_VPACK_ST	Voltage Controller MM voltage processor command acknowledge status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
29	VP_MM_TRANXDONE_ST	Voltage Processor MM transaction completion status. This status is set when a transaction is completed in the voltage processor. It is cleared by SW. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
28	VP_MM_EQVALUE_ST	Voltage Processor MM voltage value change event. This status is set when an update has been requested but the new voltage value is the same as the current SMPS voltage value. It is cleared by SW. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
27	VP_MM_NOSMPSACK_ST	Voltage Processor MM timeout event status. This status is set when the timeout occured before the SMPS acknowledge. It is cleared by SW. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
26	VP_MM_MAXVDD_ST	Voltage Processor MM voltage higher limit event status. This status is set when the voltage higher limit is reached. It is cleared by SW. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
25	VP_MM_MINVDD_ST	Voltage Processor MM voltage lower limit event status. This status is set when the voltage lower limit is reached. It is cleared by SW. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
24	VP_MM_OPPCHANGEDONE_ST	Voltage Processor MM OPP change done status, including ABB mode change done if applicable (OPP_CHANGE bit cleared in PRM_ABBLDO_MM_CRTL). It is cleared by SW. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
23	RESERVED		R	0

Bits	Field Name	Description	Type	Reset
22	VC_CORE_VPACK_ST	Voltage Controller CORE voltage processor command acknowledge status 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
21	VP_CORE_TRANXDONE_ST	Voltage Processor CORE transaction completion status. This status is set when a transaction is completed in the voltage processor. It is cleared by SW. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
20	VP_CORE_EQVALUE_ST	Voltage Processor CORE voltage value change event. This status is set when an update has been requested but the new voltage value is the same as the current SMPS voltage value. It is cleared by SW. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
19	VP_CORE_NOSMPSACK_ST	Voltage Processor CORE timeout event status. This status is set when the timeout occured before the SMPS acknowledge. It is cleared by SW. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
18	VP_CORE_MAXVDD_ST	Voltage Processor CORE voltage higher limit event status. This status is set when the voltage higher limit is reached. It is cleared by SW. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
17	VP_CORE_MINVDD_ST	Voltage Processor CORE voltage lower limit event status. This status is set when the voltage lower limit is reached. It is cleared by SW. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
16	VP_CORE_OPPCHANGEDONE_ST	Voltage Processor CORE OPP change done status. It is cleared by SW. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
15	Reserved		R	0
14	VC_BYPASSACK_ST	Voltage Controller bypass command acknowledge status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
13	VC_TOERR_ST	Voltage Controller timeout error event status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
12	VC_RAERR_ST	Voltage Controller register address acknowledge error event status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
11	VC_SAERR_ST	Voltage Controller slave address acknowledge error event status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0x0
10	RESERVED		R	0
9	IO_ST	IO pad event interrupt status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
8	TRANSITION_ST	Software supervised transition completed event interrupt status (any domain). Asserted upon completion of any clock domain force wakeup transition or upon completion of any power domain sleep transition with at least one enclosed clock domain configured in forced-sleep. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
7:5	RESERVED		R	0x0
4	DPLL_ABE_RECAL_ST	ABE DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
3	DPLL_PER_RECAL_ST	PER DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
2	DPLL_IVA_RECAL_ST	IVA DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
1	DPLL_MPU_RECAL_ST	MPU DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
0	DPLL_CORE_RECAL_ST	CORE DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0

3.11.4.2 MPU_PRM Register Description

Table 3-373. PM_MPU_PWRSTCTRL

Address Offset	0x0000 0000		
Physical Address	0x4AE0 6300	**Instance**	MPU_PRM
Description	This register controls the MPU domain power state to reach upon a domain sleep transition. If the value programmed in this register correspond to a lower power state than the one programmed in MPU SS for CPU0 and/or CPU1, then value of this register is overwritten in PRCM logic to limit the power state to enter. Even if value of this register is overwitten in PRCM logic, value of this register remains unchanged.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

3.11.6.2 ABE_PRM Register Description

Table 3-391. PM_ABE_PWRSTCTRL

Address Offset	0x0000 0000		
Physical Address	0x4AE0 6500	**Instance**	ABE_PRM
Description	This register controls the ABE domain power state to reach upon a domain sleep transition		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED										PERIPHMEM_ONSTATE		RESERVED		AESSMEM_ONSTATE		RESERVED					PERIPHMEM_RETSTATE	RESERVED	AESSMEM_RETSTATE	RESERVED			LOWPOWERSTATECHANGE	RESERVED	LOGICRETSTATE	POWERSTATE	

Bits	Field Name	Description	Type	Reset
31:22	RESERVED		R	0x000
21:20	PERIPHMEM_ONSTATE	PERIPHMEM memory state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R	0x3
19:18	RESERVED		R	0x0
17:16	AESSMEM_ONSTATE	AESSMEM memory state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R	0x3
15:11	RESERVED		R	0x00
10	PERIPHMEM_RETSTATE	PERIPHMEM memory state when domain is RETENTION. Read 0x0: Memory bank is off when the domain is in the RETENTION state.	R	0
9	RESERVED		R	0
8	AESSMEM_RETSTATE	AESSMEM memory state when domain is RETENTION. Read 0x1: Memory bank is retained when domain is in RETENTION state.	R	1
7:5	RESERVED		R	0x0
4	LOWPOWERSTATECHANGE	Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0: Do not request a low power state change. 0x1: Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON.	RW WSpecial	0
3	RESERVED		R	0
2	LOGICRETSTATE	Logic state when power domain is RETENTION Read 0x0: Whole logic is off when the domain is in RETENTION state.	R	0
1:0	POWERSTATE	Power state control 0x0: Reserved 0x1: RETENTION state 0x2: INACTIVE state 0x3: ON State	RW	0x0

3.11.8.2 CORE_PRM Register Description

Table 3-455. PM_CORE_PWRSTCTRL

Address Offset	0x0000 0000		
Physical Address	0x4AE0 6700	**Instance**	CORE_PRM
Description	This register controls the CORE power state to reach upon a domain sleep transition		
Type	RW		

31 30 29 28 27 26	25 24	23 22	21 20	19 18	17 16	15 14 13	12	11	10	9	8	7 6 5	4	3	2	1 0
RESERVED	OCP_NRET_BANK_ONSTATE	IPU_SCACHE_ONSTATE	IPU_L2RAM_ONSTATE	CORE_OCMRAM_ONSTATE	CORE_OTHER_BANK_ONSTATE	RESERVED	OCP_NRET_BANK_RETSTATE	IPU_SCACHE_RETSTATE	MPU_M3_L2RAM_RETSTATE	CORE_OCMRAM_RETSTATE	CORE_OTHER_BANK_RETSTATE	RESERVED	LOWPOWERSTATECHANGE	RESERVED	LOGICRETSTATE	POWERSTATE

Bits	Field Name	Description	Type	Reset
31:26	RESERVED		R	0x00
25:24	OCP_NRET_BANK_ONSTATE	OCP_NRET_BANK state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R	0x3
23:22	IPU_SCACHE_ONSTATE	IPU SCACHE bank state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R	0x3
21:20	IPU_L2RAM_ONSTATE	IPU L2 bank state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R	0x3
19:18	CORE_OCMRAM_ONSTATE	OCMRAM bank state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R	0x3
17:16	CORE_OTHER_BANK_ONSTATE	CORE_OTHER_BANK state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R	0x3
15:13	RESERVED		R	0x0
12	OCP_NRET_BANK_RETSTATE	OCP_NRET_BANK state when domain is RETENTION. Read 0x0: Memory bank is off when the domain is in the RETENTION state.	R	0
11	IPU_SCACHE_RETSTATE	IPU SCACHE bank state when domain is RETENTION. 0x0: Memory bank is off when the domain is in the RETENTION state. 0x1: Memory bank is retained when domain is in RETENTION state.	RW	1
10	IPU_L2RAM_RETSTATE	IPU L2 bank state when domain is RETENTION. 0x0: Memory bank is off when the domain is in the RETENTION state. 0x1: Memory bank is retained when domain is in RETENTION state.	RW	1
9	CORE_OCMRAM_RETSTATE	OCMRAM bank state when domain is RETENTION. Read 0x1: Memory bank is retained when domain is in RETENTION state.	R	1
8	CORE_OTHER_BANK_RETSTATE	CORE_OTHER_BANK state when domain is RETENTION. Read 0x1: Memory bank is retained when domain is in RETENTION state.	R	1
7:5	RESERVED		R	0x0
4	LOWPOWERSTATECHANGE	Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0: Do not request a low power state change. 0x1: Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON.	RW WSpecial	0

Bits	Field Name	Description	Type	Reset
3	RESERVED		R	0
2	LOGICRETSTATE	Logic state when power domain is RETENTION 0x0: Only retention registers are retained and remaing logic is off when the domain is in RETENTION state. 0x1: Whole logic is retained when domain is in RETENTION state.	RW	1
1:0	POWERSTATE	Power state control Read 0x0: Reserved 0x1: RETENTION state 0x2: INACTIVE state 0x3: ON State	RW	0x3

3.11.13.2 L3INIT_PRM Register Description

Table 3-684. PM_L3INIT_PWRSTCTRL

Address Offset	0x0000 0000		
Physical Address	0x4AE0 7600	**Instance**	L3INIT_PRM
Description	This register controls the L3INIT power state to reach upon a domain sleep transition		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED												L3INIT_BANK2_ONSTATE		L3INIT_BANK1_ONSTATE		RESERVED							L3INIT_BANK2_RETSTATE	L3INIT_BANK1_RETSTATE	RESERVED			LOWPOWERSTATECHANGE	RESERVED	LOGICRETSTATE	POWERSTATE	

Bits	Field Name	Description	Type	Reset
31:20	RESERVED		R	0x0000
19:18	L3INIT_BANK2_ONSTATE	L3INIT BANK2 state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R	0x3
17:16	L3INIT_BANK1_ONSTATE	L3INIT BANK1 state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R	0x3
15:10	RESERVED		R	0x00
9	L3INIT_BANK2_RETSTATE	L3INIT BANK2 state when domain is RETENTION. Read 0x1: Memory bank is retained when domain is in RETENTION state.	R	0x1
8	L3INIT_BANK1_RETSTATE	L3INIT BANK1 state when domain is RETENTION. Read 0x0: Memory bank is off when the domain is in the RETENTION state.	R	0
7:5	RESERVED		R	0x0
4	LOWPOWERSTATECHANGE	Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0: Do not request a low power state change. 0x1: Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON.	RW WSpecial	0
3	RESERVED		R	0
2	LOGICRETSTATE	Logic state when power domain is RETENTION 0x0: Only retention registers are retained and remaing logic is off when the domain is in RETENTION state. 0x1: Whole logic is retained when domain is in RETENTION state.	RW	1
1:0	POWERSTATE	Power state control 0x0: Reserved 0x1: RETENTION state 0x2: INACTIVE state 0x3: ON State	RW	0x0

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0000
15	CLKACTIVITY_SYS_CLK_ALL	This field indicates the state of the SYS_CLK runing at SCRM level because of any SCRM clock request. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0

Bits	Field Name	Description	Type	Reset
14	CLKACTIVITY_SYS_CLK_FUNC	This field indicates the state of the functional SYS_CLK clocks in the domain (this exclude activity of EMU_SYS_GCLK clock). [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
13	CLKACTIVITY_WKUPAON_IO_SRCOMP_GFCLK	This field indicates the state of the WKUPAON_IO_SRCOMP_GFCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
12	CLKACTIVITY_L4_WKUPAON_GICLK	This field indicates the state of the WKUPAON_GICLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
11	CLKACTIVITY_WKUPAON_32K_GFCLK	This field indicates the state of the WKUPAON_32K_GFCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
10	RESERVED		R	0
9	CLKACTIVITY_ABE_LP_CLK	This field indicates the state of the ABE_LP_CLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
8	CLKACTIVITY_SYS_CLK	This field indicates the state of the SYS_CLK clock in the domain (it includes profiling, EMU_SYS_GCLK and all functional SYS_CLK). [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
7:2	RESERVED		R	0x00
1:0	CLKTRCTRL	Controls the clock state transition of the WKUPAON clock domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. Read 0x1: Reserved 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.	RW	0x0

Table 3-806. PRM_IO_PMCTRL

Address Offset	0x0000 0020		
Physical Address	0x4AE0 7C20	**Instance**	DEVICE_PRM
Description	This register allows controlling power management features of the IOs.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED															GLOBAL_WUEN	RESERVED						WUCLK_STATUS	WUCLK_CTRL	RESERVED		IO_ON_STATUS	ISOOVR_EXTEND	RESERVED		ISOCLK_STATUS	ISOCLK_OVERRIDE

Bits	Field Name	Description	Type	Reset
31:17	RESERVED		R	0x0000
16	GLOBAL_WUEN	Global IO wakeup enable. This is a gating condition to all individual IO WUEN coming from control module. Gating is done in the Spinner logic. 0x0: All individual IO WUEN are gated in the Spinner logic (overriden to 0). 0x1: All individual IO WUEN from control module are going to IOs.	RW	0
15:10	RESERVED		R	0x00
9	WUCLK_STATUS	Gives value of WUCLKOUT signal coming back from IO pad ring.	R	0
8	WUCLK_CTRL	Direct control on WUCLKIN signal to IO pad ring. 0x0: WUCLKIN signal is driven to 0. IO wakeup daisy chain is functional as well as IO whose wakeup feature is enabled. 0x1: WUCLKIN signal is driven to 1. IO wakeup daisy chain is reset and is latching current pad states and WUEN inputs.	RW	0
7:6	RESERVED		R	0x0

Bits	Field Name	Description	Type	Reset
5	IO_ON_STATUS	Gives the functional status of the IO ring. Read 0x0: Part or all of the IOs are not in the ON state, that is are in isolation state Read 0x1: All IOs are in the ON state	R	1
4	ISOOVR_EXTEND	Control non-EMIF IO isolation extension upon a device wakeup from low-power mode. 0x0: Non-EMIF IO isolation is not extended. EMIF_ON IO transition happens as soon as automatic restore is completed 0x1: Non-EMIF IO isolation is extended. EMIF_ON IO transition is stalled	RW	0
3:2	RESERVED		R	0x0
1	ISOCLK_STATUS	Gives value of ISOCLKOUT signal coming back from IO pad ring.	R	0
0	ISOCLK_OVERRIDE	Override control on ISOCLKIN signal to IO pad ring. Override should be used at boot time only when it is needed to change the mode of an IO from 1.8V default mode to 1.2V mode. When not overriden, this signal is controlled by hardware only. 0x0: ISOCLKIN signal is not overriden. 0x1: ISOCLKIN signal is overriden to active value ('1').	RW	0

3.11.26.2 ABE_CM_CORE_AON Register Description

Table 3-1049. CM_ABE_CLKSTCTRL

Address Offset	0x0000 0000		
Physical Address	0x4A00 4500	**Instance**	ABE_CM_CORE_AON
Description	This register enables the ABE domain power state transition. It controls the HW supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also holds 1 status bit per clock input of the domain.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																CLKACTIVITY_PAD_SLIMBUS1_CLK	CLKACTIVITY_PAD_CLKS	CLKACTIVITY_ABE_24M_GFCLK	CLKACTIVITY_ABE_32K_CLK	CLKACTIVITY_ABE_SYS_CLK	CLKACTIVITY_FUNC_24M_GFCLK	CLKACTIVITY_ABE_GICLK	CLKACTIVITY_ABE_X2_CLK	RESERVED						CLKTRCTRL	

Bits	Field Name	Description	Type	Reset
31:16	RESERVED	Reserved	R	0x00000
15	CLKACTIVITY_PAD_SLIMBUS1_CLK	This field indicates the state of the SLIMBUS_CLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0

Bits	Field Name	Description	Type	Reset
14	CLKACTIVITY_PAD_CLKS	This field indicates the state of the PAD_CLKS clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
13	CLKACTIVITY_ABE_24M_GFCLK	This field indicates the state of the ABE_24M_GFCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
12	CLKACTIVITY_ABE_32K_CLK	This field indicates the state of the ABE_32K_CLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
11	CLKACTIVITY_ABE_SYS_CLK	This field indicates the state of the ABE_SYS_CLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
10	CLKACTIVITY_FUNC_24M_GFCLK	This field indicates the state of the FUNC_24M_GFCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
9	CLKACTIVITY_ABE_GICLK	This field indicates the state of the ABE_GICLK interface clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
8	CLKACTIVITY_DPLL_ABE_X2_CLK	This field indicates the state of the DPLL_ABE_X2_CLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
7:2	RESERVED	Reserved	R	0x00
1:0	CLKTRCTRL	Controls the clock state transition of the ABE clock domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1: SW_SLEEP: Start a software forced sleep transition on the domain. 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.	RW	0x3

Table 3-1051. CM_ABE_L4_ABE_CLKCTRL

Address Offset	0x0000 0020		
Physical Address	0x4A00 4520	**Instance**	ABE_CM_CORE_AON
Description	This register manages the L4ABE clocks.		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED														IDLEST		RESERVED														MODULEMODE	

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0000
17:16	IDLEST	Module idle status. [warm reset insensitive] Read 0x0: Module is fully functional, including INTRCONN Read 0x1: Module is performing transition: wakeup, or sleep, or sleep abortion Read 0x2: Module is in Idle mode (only INTRCONN part). It is functional if using separate functional clock Read 0x3: Module is disabled and cannot be accessed	R	0x3
15:2	RESERVED		R	0x0000
1:0	MODULEMODE	Control the way mandatory clocks are managed. Read 0x1: Module is managed automatically by HW according to clock domain transition. A clock domain sleep transition put module into idle. A wakeup domain transition put it back into function. If CM_ABE_CLKSTCTRL[1:0] CLKTRCTRL = 0x3 (HW_AUTO), any INTRCONN access to module is always granted. Module clocks may be gated according to the clock domain state.	R	0x1

3.11.30.2 CKGEN_CM_CORE Register Description

Table 3-1101. CM_CLKSEL_USB_60MHZ

Address Offset	0x0000 0004		
Physical Address	0x4A00 8104	**Instance**	CKGEN_CM_CORE
Description	Selects the configuration of the divider generating 60MHz clock for USB from the DPLL_USB o/p.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																															CLKSEL

Bits	Field Name	Description	Type	Reset
31:1	RESERVED		R	0x0000 0000
0	CLKSEL	Select the configuration of the divider 0x0: Set the divider in bypass mode to support bypass clock from DPLL_USB to pass through without division. 0x1: Set the divider to divide the DPLL o/p (480MHz typical) by 8 to generate 60MHz clock, to be used for both OPP_NOM and OPP_LOW.	RW	1

DPLL_SD_DIV								DPLL_BYP_CLKSEL	DCC_EN	DPLL_SELFREQDCO	RESERVED	DPLL_MULT												DPLL_DIV							

Bits	Field Name	Description	Type	Reset
31:24	DPLL_SD_DIV	Sigma-Delta divider select (2-255). This factor must be set by software to ensure optimum jitter performance. DPLL_SD_DIV = CEILING ([DPLL_MULT/(DPLL_DIV+1)] * CLKINP / 250), where CLKINP is the input clock of the DPLL in MHz). DPLL_MULT must be set with M multiplier factor and DPLL_DIV with N divider factor, and must not be changed once DPLL is locked. For more information, see Section 3.6.3.9, *DPLL_USB Description*. 0x0: Reserved 0x1: Reserved	RW	0x04
23	DPLL_BYP_CLKSEL	Allows control of the BYPASS clock of the PLL and the associated HSDIVIDER. Same as ULOWCLKEN on DPLL. In DPLL Locked mode, 0 - No impact 1 - No impact In DPLL Bypass mode, 0 - CLKINP is selected as the BYPASS clock for CLKOUT 1 - CLKINPULOW is selected as the BYPASS clock for CLKOUT	RW	0

Bits	Field Name	Description	Type	Reset
22	DCC_EN	Duty-cycle corrector for high frequency clock Read 0: Duty-cycle corrector is disabled	R	0x0
21	DPLL_SELFREQDCO	Select DCO output according to required frequency. 0x0: DCO clock is 1500MHz SELFREQDCO input of DPLL is set to '010' 0x1: DCO clock is 1250MHz SELFREQDCO input of DPLL is set to '100''	RW	0x0
20	RESERVED		R	0x0
19:8	DPLL_MULT	DPLL multiplier factor (2 to 4095). Equal to input M (multiplier) factor of DPLL; M=2 to 4095 = DPLL multiplies by M. [warm reset insensitive] 0x0: Reserved 0x1: Reserved	RW	0x000
7:0	DPLL_DIV	DPLL divider factor (0 to 255) Equal to input N (divider) factor of DPLL; actual division factor is N+1 [warm reset insensitive]	RW	0x00

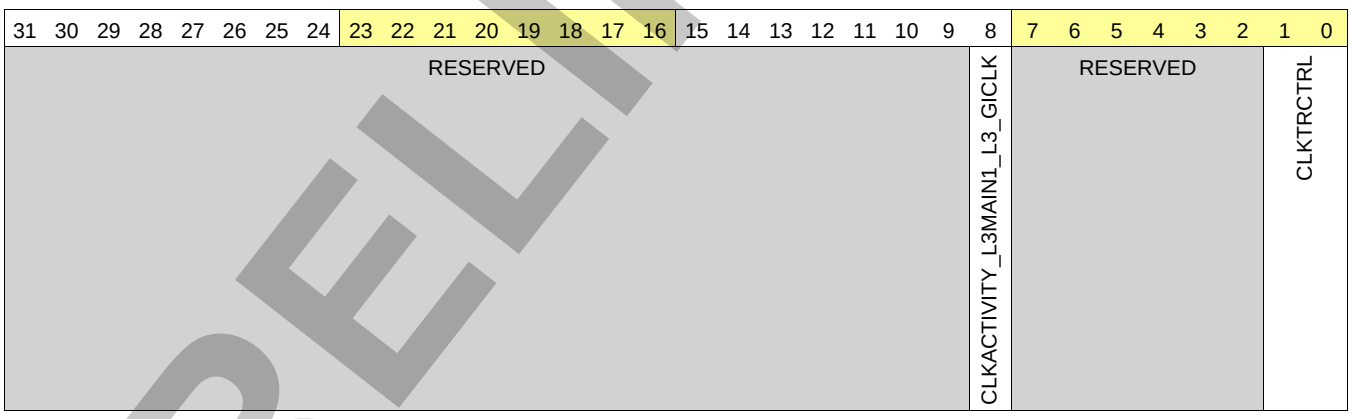
3.11.32.2 CORE_CM_CORE Register Description

Table 3-1155. CM_L3MAIN1_CLKSTCTRL

Address Offset	0x0000 0000
Physical Address	0x4A00 8700 **Instance** CORE_CM_CORE
Description	This register enables the domain power state transition. It controls the HW supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also holds 1 status bit per clock input of the domain.
Type	RW



Bits	Field Name	Description	Type	Reset
31:9	RESERVED	Reserved	R	0x000000
8	CLKACTIVITY_L3MAIN1_L3_GICLK	This field indicates the state of the L3MAIN1_L3_GICLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
7:2	RESERVED	Reserved	R	0x00

Bits	Field Name	Description	Type	Reset
1:0	CLKTRCTRL	Controls the clock state transition of the L3_MAIN1 clock domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. Read 0x1: Reserved Read 0x2: Reserved 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.	RW	0x0

Any Interconnect access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1: Module is managed automatically by HW according to clock domain transition. A clock domain sleep transition put module into idle. A wakeup domain transition put it back into function. If CM_L3INIT_CLKSTCTRL[1:0] CLKTRCTRL = 0x3 (HW_AUTO), any Interconnect access to module is always granted. Module clocks may be gated according to the clock domain state. Read 0x2: Reserved Read 0x3: Reserved	RW	0x0

Dual Cortex-A15 MPU Subsystem

This chapter describes the dual Cortex™-A15 MPU subsystem.

Topic **Page**

4.1 Dual Cortex-A15 MPU Subsystem Overview

4.1.1 Introduction

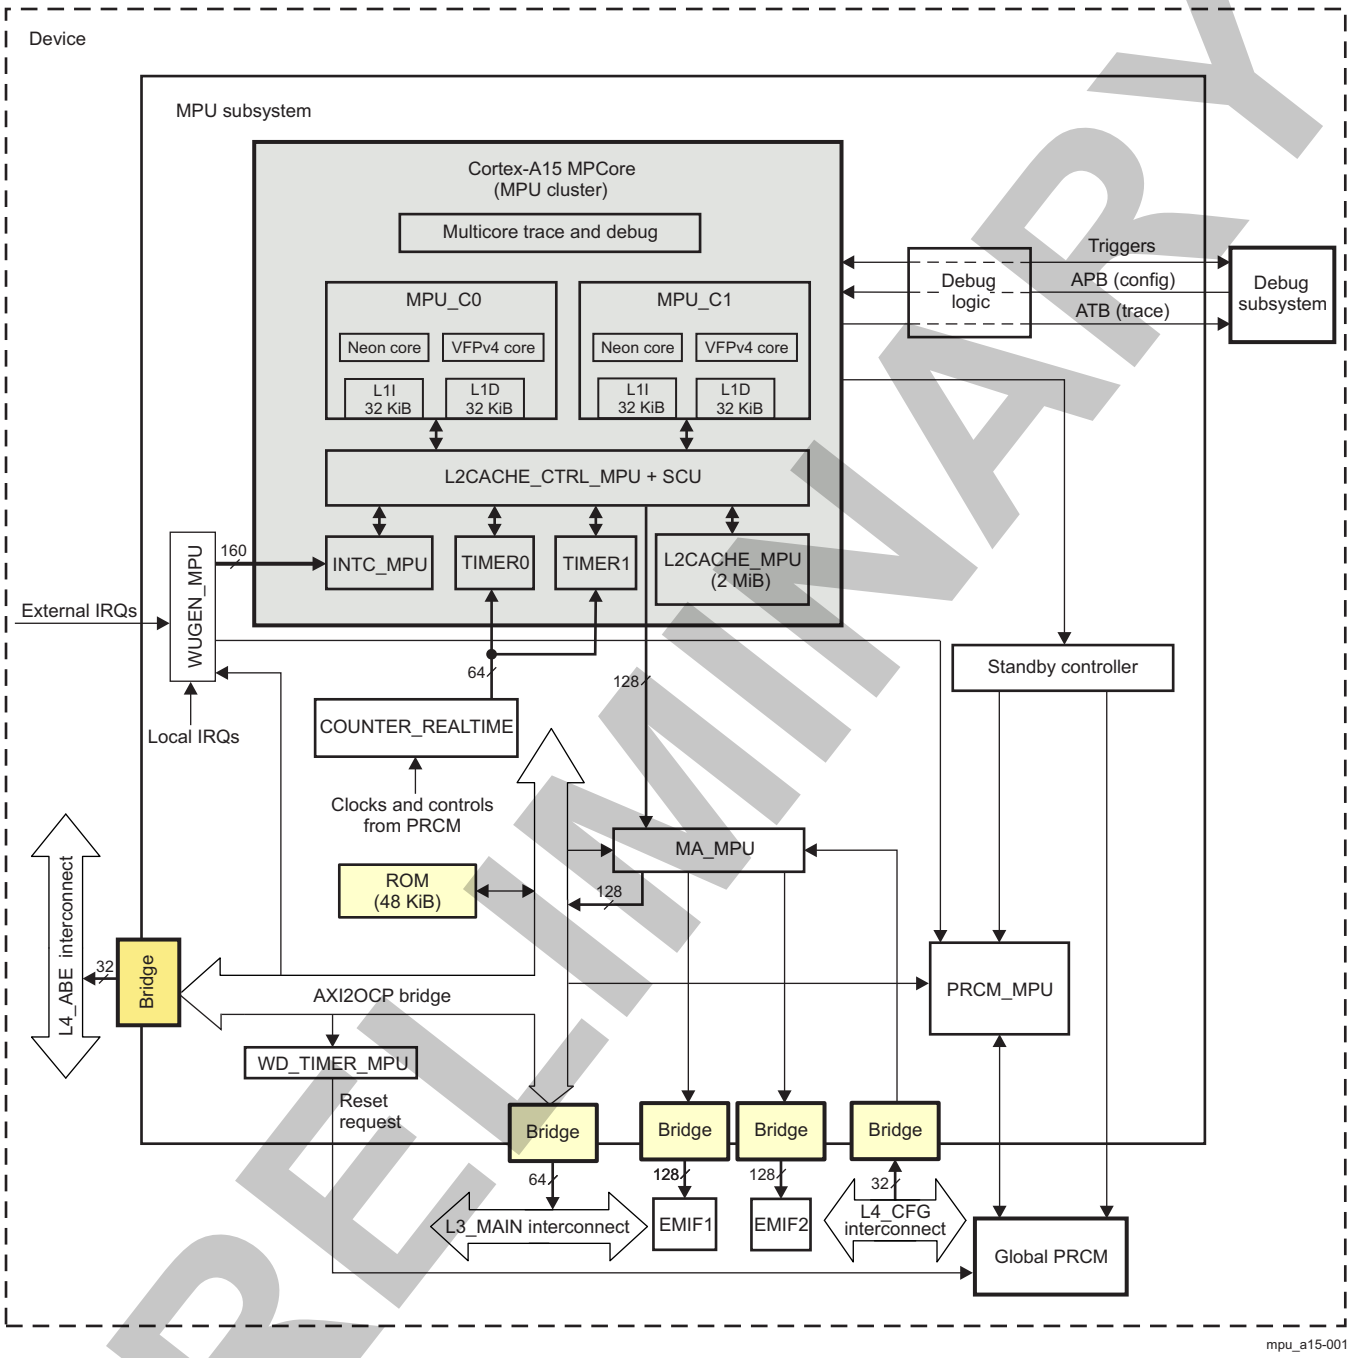
The dual Cortex™-A15 microprocessor unit (MPU) subsystem serves the applications processing role by running the high-level operating system (HLOS) and application code. The MPU subsystem is based on the symmetric multiprocessor (SMP) architecture, and thus it delivers high performance and optimal power management, debug, and emulation capabilities.

The MPU subsystem incorporates two Cortex-A15 MPU cores (MPU_C0 and MPU_C1), individual level 1 (L1) caches, level 2 (L2) cache (L2CACHE_MPU) shared between them, and various other shared peripherals. To aid software development, the processor cores are kept cache-coherent with each other and with the L2 cache.

The MPU subsystem provides a high-performance computing platform with high peak-computing performance and low memory latency, while also supporting a configuration to shut off one core and run the other at low voltage and low frequency to achieve low-power operation.

Figure 4-1 is a high-level block diagram of the MPU subsystem.

Figure 4-1. MPU Subsystem Overview



4.1.2 Features

The MPU subsystem integrates the following:

- ARM®Cortex-A15 MPCore™ (MPU cluster)
  - Two Cortex-A15 MPU cores (revision r2p2, SMP architecture), each of them having the following features:
    - Superscalar, dynamic multi-issue technology
      - Out-of-order (OoO) instruction dispatch and completion
      - Dynamic branch prediction with branch target buffer (BTB), global history buffer (GHB), and 48-entry return stack
      - Continuous fetch and decoding of three instructions per clock cycle
      - Dispatch of up to four instructions and completion of eight instructions per clock cycle
      - Provides optimal performance from binaries compiled for previous ARM processors
      - Five execution units handle simple instructions, branch instructions, Neon™ and floating point instructions, multiply instructions, and load and store instructions.
      - Simple instructions take two cycles from dispatch, while complex instructions take up to 11 cycles.
      - Can issue two simple instructions in a cycle
      - Can issue a load and a store instruction in the same cycle
    - Integrated Neon processing engine to include the ARM Neon Advanced SIMD (single instruction, multiple data) support for accelerated media and signal processing computation
    - Includes VFPv4-compatible hardware to support single- and double-precision add, subtract, divide, multiply and accumulate, and square root operations
    - Extensive support to accelerate virtualization using a hypervisor
    - 32-KiB L1 instruction (L1I) and 32-KiB L1 data (L1D) cache:
      - 64-byte line size
      - 2-way set associative
    - Memory management unit (MMU):
      - Two-level translation lookaside buffer (TLB) organization
        - First level is an 32-entry, fully associative micro-TLB implemented for each of instruction fetch, load, and store.
        - Second level is a unified, 4-way associative, 512-entry main TLB
      - Supports hardware TLB table-walk for backward-compatible and new 64-bit entry page table formats
      - New page table format can produce 40-bit physical addresses
      - Two-stage translation where first stage is HLOS-controlled and the second level may be controlled by a hypervisor. Second stage always uses the new page table format
  - Integrated L2 cache (L2CACHE_MPU) and snoop control unit (SCU):
    - 2-MiB of unified (instructions and data) cache organized as 16 ways of 2048 sets of 64-byte lines
    - Redundant L1 data (cache) tags to perform snoop filtering (L1 instruction cache tags are not duplicated)
    - Operates at Cortex-A15 MPU core clock rate
    - Integrated L2 cache controller (L2CACHE_CTRL_MPU):
      - Sixteen 64-byte line buffers that handle evictions, line fills and snoop transfers
      - One 128-bit AMBA4 Coherent Bus (AXI4-ACE) port
      - Auto-prefetch buffer for up to 16 streams per core and detecting forward and backward strides
      - L1 cache coherency between the MPU cores is maintained by the L2 cache controller, which

also serves as a snoop controller.
    - SCU ensures memory coherency between the two MPU cores
  - Generalized interrupt controller (GIC, also referred to as INTC_MPU): An interrupt controller (INTC) supplied by ARM. The single GIC in the MPU cluster routes interrupts to each of the MPU cores. The GIC supports:
    - Number of shared peripheral interrupts (SPI): 160
    - Number of software generated interrupts (SGI): 16
    - Number of CPU interfaces: 2
    - Virtual CPU interface for virtualization support. This allows the majority of guest operating system (OS) interactions with the GIC to be handled in hardware, but with physical interrupts still requiring hypervisor intervention to assign them to the appropriate virtual machine.
  - Integrated timer counter and one timer block per MPU core
  - ARM CoreSight™ debug and trace modules. For more information, see Chapter 29, *On-Chip Debug Support*.
- AXI2OCP bridge (local interconnect):
  - Connected to Memory Adapter (MA_MPU), which routes the non-EMIF address space transactions to AXI2OCP
  - Single request multiple data (SRMD) protocol on L3_MAIN port
  - Multiple targets:
    - 64-bit port to the L3_MAIN interconnect. Interface frequency is 1/4 or 1/8 of core frequency
    - 32-bit port to audio back-end (ABE): This enables direct connection between ARM microprocessor and the ABE module to reduce power consumption during long audio playback. ABE interface frequency is 1/8 or 1/16 of core frequency
    - ROM
    - Internal MPU subsystem peripheral targets, including Memory Adapter LISA Section Manager (MA_LSM), wake-up generator (WUGEN_MPU), and local PRCM module (PRCM_MPU) configuration
    - Internal AXI target, CoreSight System Trace Module (CS_STM)
- Memory adapter (MA_MPU): Helps decrease the latency of accesses between the L2CACHE_MPU and the two EMIFs (EMIF0 and EMIF1) by providing a direct path between the MPU subsystem and the EMIFs:
  - Connected to 128-bit AMBA4 interface of MPU cluster
  - Direct 128-bit interface to each of EMIF0 and EMIF1
  - Interface speed between MPU cluster and MA_MPU is at half-speed of MPU cluster internal core frequency
  - Programmable one-fourth (default value) or one-sixth speed interface (versus reference clock) to the EMIFs
  - Performs interleaving functions to load-balance the activities across the two EMIFs
  - Uses firewall logic to check access rights of incoming addresses
- Local PRCM (PRCM_MPU):
  - Handles MPU_C0 and MPU_C1 power domains
  - Supports SR3-APG (SmartReflex3 Automatic Power Gating) power management technology inside the MPU cluster
  - MPU subsystem has six power domains
- Wake-up generator (WUGEN_MPU)
  - Responsible for waking up the MPU cores
  - Used by the ROM code and OS during SMP boot
- Standby controller: Handles the power transitions inside the MPU subsystem
- Realtime (master) counter (COUNTER_REALTIME): Produces the count used by the private timer

peripherals in the MPU cluster

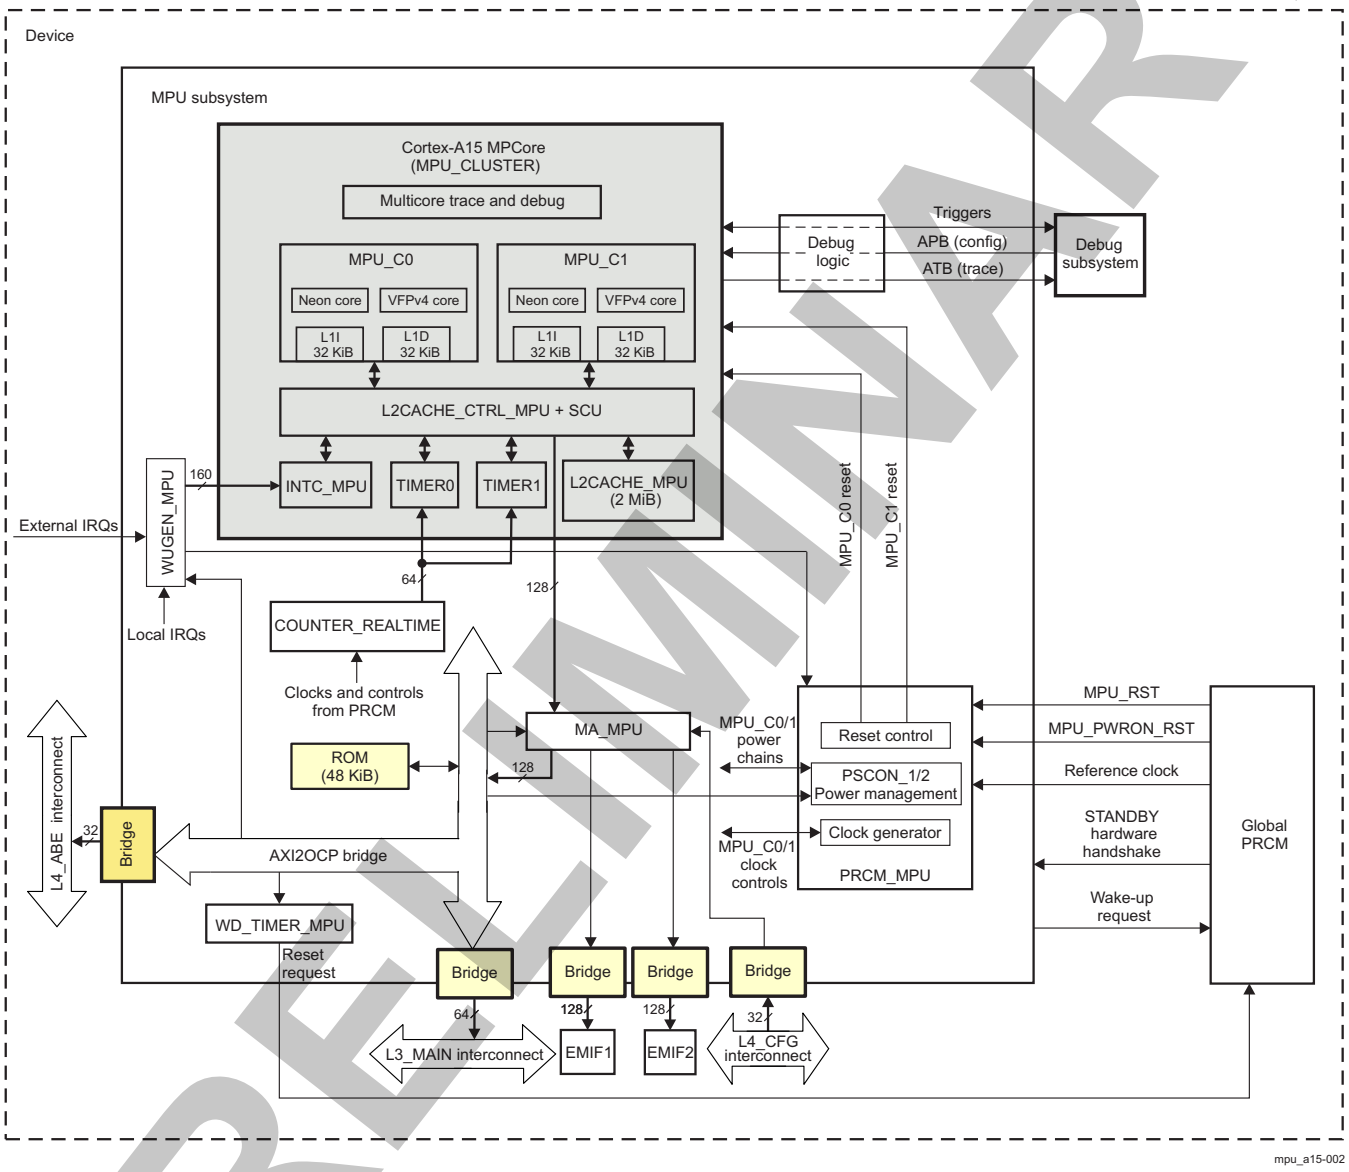
- Watchdog timer (WD_TIMER_MPU): Used to generate a watchdog reset request to global PRCM
- On-chip ROM: MPU_C0 (the master MPU core) can boot from this memory. The ROM size is 48-KiB, and the address range is from 0x4003 8000 to 0x4004 3FFF. For more information, see Chapter 28, *Initialization*.
- Interfaces:
  - 128-bit interface to each of EMIF0 and EMIF1
  - 64-bit master port to the L3_MAIN interconnect
  - 32-bit master port to ABE for enabling direct connection between the Cortex-A15 MPCore and the ABE module to reduce power consumption during long audio playback
  - 32-bit slave port from the L4_CFG_EMU interconnect (debug subsystem) for configuration of the MPU subsystem debug modules
  - 32-bit slave port from the L4_CFG interconnect for memory adapter firewall (MA_MPU_NTTP_FW) configuration
  - 32-bit ATB output for transmitting debug and trace data
  - 160 peripheral interrupt inputs

4.2 Dual Cortex-A15 MPU Subsystem Integration

This section describes the integration of the module in the device, including information about clocks, resets, and hardware requests.

Figure 4-2 shows the MPU subsystem integration.

Figure 4-2. MPU Subsystem Integration



NOTE: Some debug, trace, and emulation features are implemented in the MPU subsystem. For more information about debug and emulation features, see Chapter 29, *On-Chip Debug Support*.

NOTE: For more information about the STANDBY hardware handshake and the wake-up request, see Module-Level Clock Management, in Chapter 3, *Power, Reset, and Clock Management*.

Table 4-1 and Table 4-2 summarize the integration of the module in the device.

Table 4-1. Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
MPU	PD_MPU	L3_MAIN

Table 4-2. Clocks and Resets

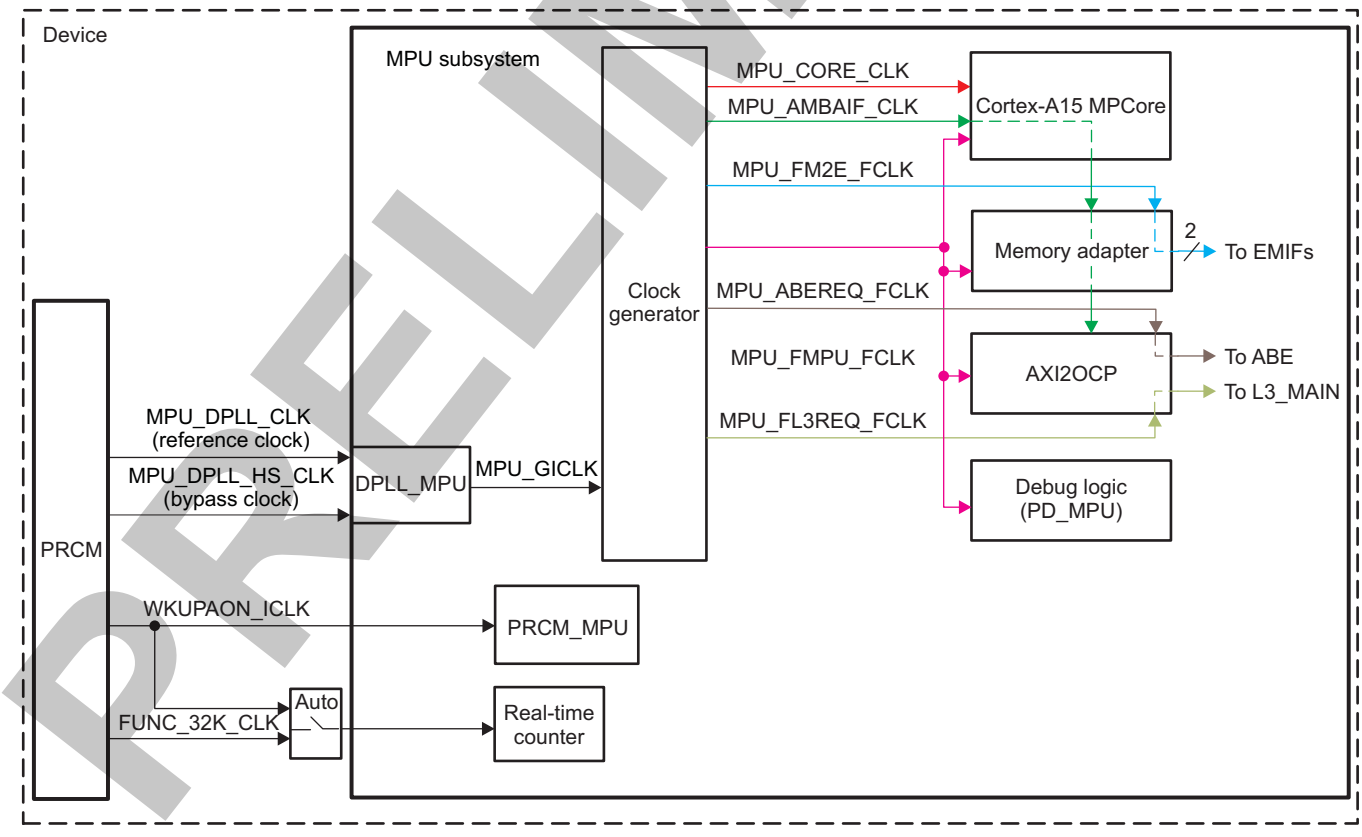
			Clocks	
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
MPU	MPU_DPLL_CLK	MPU_DPLL_CLK	PRCM	Reference clock for the MPU clock generator
			Resets	
MPU	MPU_PWRON_RST	MPU_PWRON_RST	PRCM	Power-on reset (POR) for all the modules inside the MPU system power domain; nonretention
	MPU_RST	MPU_RST	PRCM	Warm reset for all the modules inside the MPU system power domain; nonretention

4.2.1 Clock Distribution

The Cortex-A15 MPU clock generator is fed by the MPU digital phase-locked loop (DPLL), which can be gated off by the global power, reset, and clock management (PRCM) module when system power domain is in a low-power state. There is a global clock gating for each CPU. Because of the DPLL_MPU, the MPU subsystem is asynchronous from the rest of the device.

Figure 4-3 shows the MPU subsystem clocking scheme.

Figure 4-3. MPU Subsystem Clocking Scheme



The clock generator generates the following clocks from the DPLL_MPU output clock (MPU_GICLK):

- MPU_CORE_CLK
- MPU_AMBAIF_CLK
- MPU_FMPU_FCLK
- MPU_FL3REQ_FCLK
- MPU_ABEREQ_FCLK
- MPU_FM2E_FCLK

MPU_CORE_CLK is directly derived (no hardware dividing) from the DPLL_MPU output clock (that is, MPU_CORE_CLK = MPU_GICLK). The other clocks are derived via dividers.

Table 4-3 shows the supported frequency values for MPU subsystem clocks at different OPPs.

Table 4-3. MPU Subsystem Clocks Frequency Value Versus OPP

Clocks (Derived From DPLL_MPU)	OPP_LOW	OPP_NOM	OPP_HIGH	OPP_SPEEDBIN
MPU_CORE_CLK (f)	See (1)	See (1)	See (1)	See (1)
MPU_AMBAIF_CLK	f/2	f/2	f/2	f/2
MPU_FMPU_FCLK	f/4	f/4	f/4	f/4
MPU_FL3REQ_FCLK	f/4	f/4	f/8	f/8
MPU_ABEREQ_FCLK	f/8	f/8	f/16	f/16
MPU_FM2E_FCLK	f/4	f/4	f/6	f/6

(1) See device *Data Manual* for information about frequency value

NOTE: For more information about the DPLL_MPU, see DPLL_MPU Description, in Chapter 3, *Power, Reset, and Clock Management*.

The two MPU cores cannot be clocked at different frequencies.

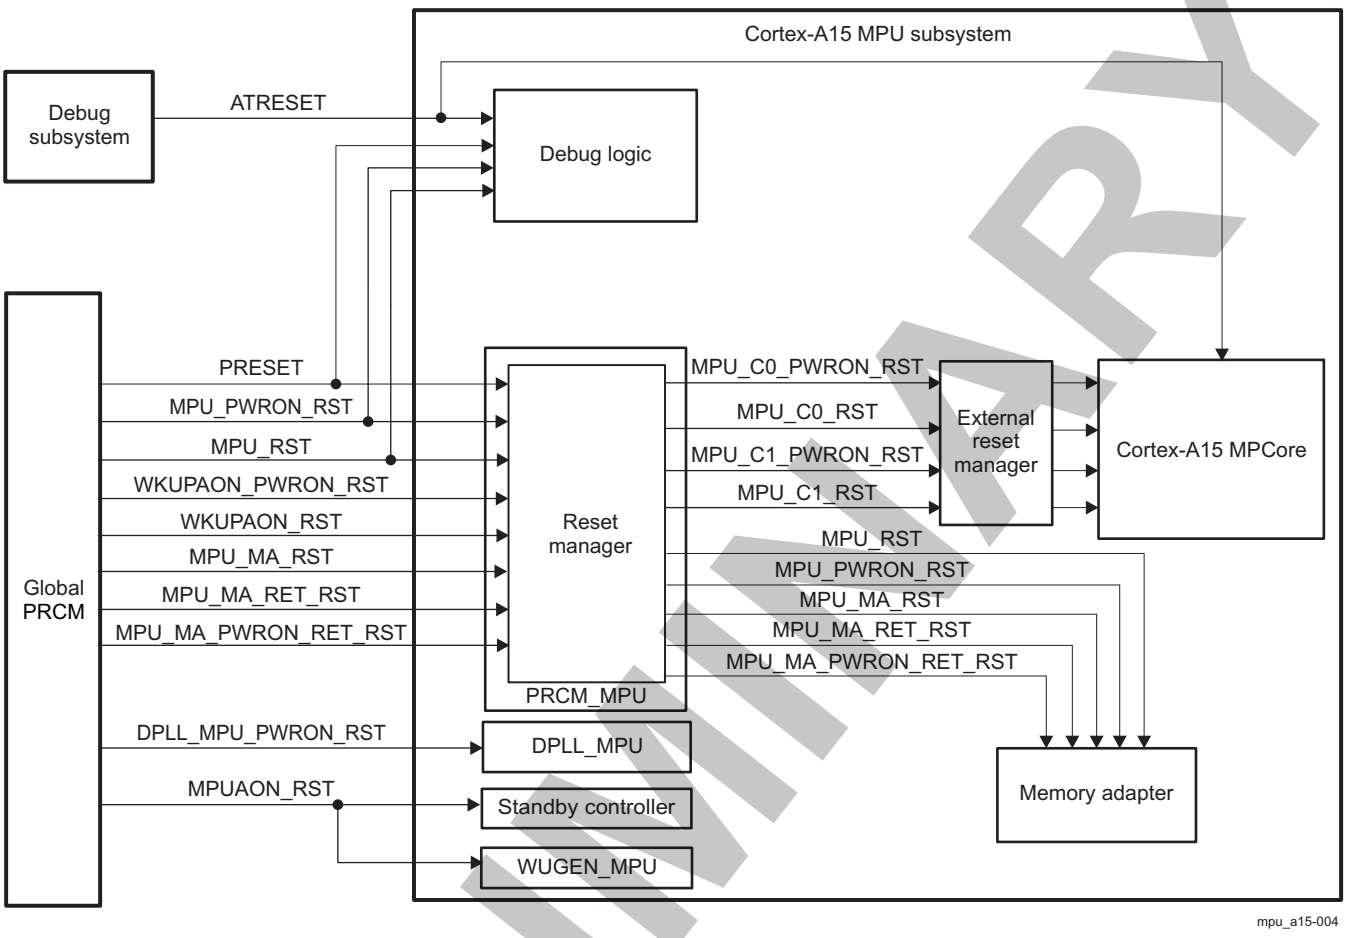
The realtime counter (COUNTER_REALTIME) is clocked by either WKUPAON_ICLK or FUNC_32K_CLK clocks, provided by the global PRCM module. By default, WKUPAON_ICLK is used as a COUNTER_REALTIME clock. When the MPU subsystem goes to standby mode, the counter automatically switches to a low-power mode using the 32-kHz clock (FUNC_32K_CLK).

4.2.2 Reset Distribution

Resets to the MPU subsystem are provided by the global PRCM module and controlled by the local PRCM_MPU module.

For more information about the power domains in the MPU subsystem, see Section 4.3.7.1, *Power Domains*. Figure 4-4 shows the reset scheme of the MPU subsystem.

Figure 4-4. MPU Subsystem Reset Scheme



All eight external resets that are input to the local PRCM signals are active low. All 11 external reset input signals are driven by the global PRCM, except the ATRESET reset signal, which is driven by the device debug subsystem. Four internal reset signals are generated by the local PRCM module.

ATRESET is asserted at initial device power up and resets the debug and trace modules. ATRESET affects the debug logic of the MPU cluster and its cores.

The PRESET reset signal resets the debug logic in the Cortex-A15 MPU and ARM MPU cores.

The WKUPAON_PWRON_RST reset signal is a global cold reset for the wake-up logic and resets the wake-up domain logic (the PSCON modules) in the local PRCM module. A cold reset is typically asserted when power is initially applied to the system. The user can check whether this reset event has occurred by reading the PRM_RSTST[0] GLOBAL_COLD_RST bit.

The WKUPAON_RST reset signal is a global warm reset that resets the wake-up domain logic (the PSCON modules) in the local PRCM module. Warm reset is typically used to reset a system that has been operating for some time. The user can check whether this reset event has occurred by reading the PRM_RSTST[1] GLOBAL_WARM_RST bit.

The DPLL_MPU_PWRON_RST reset signal resets the DPLL_MPU.

The MPUAON_RST reset signal resets the MPU always-on domain: the standby controller and the WUGEN_MPU. The user can check whether the reset has occurred by reading the WKG_CONTROL_0[15] DOMAIN_RST bit for MPU_C0 and the WKG_CONTROL_1[15] DOMAIN_RST bit for MPU_C1.

The MA_MPU has five incoming reset signals:

- MPU_RST

- MPU_PWRON_RST
- MPU_MA_RST
- MPU_MA_RET_RST
- MPU_MA_PWRON_RET_RST

These five reset signals are driven by the Cortex-A15 MPU local reset manager and are active low.

The local PRCM module provides two reset signals for each CPU:

- The MPU_C0_RST and MPU_C1_RST reset signals are warm reset events. These reset signals initialize most of the ARM MPU cores, except the debug logic (breakpoints and watchpoints are retained during this reset). The user can check whether these reset events have occurred by reading the RM_CPUx_RSTCTRL[0] RST bit.
- The MPU_C0_PWRON_RST and MPU_C1_PWRON_RST reset signals are cold and debug reset events.

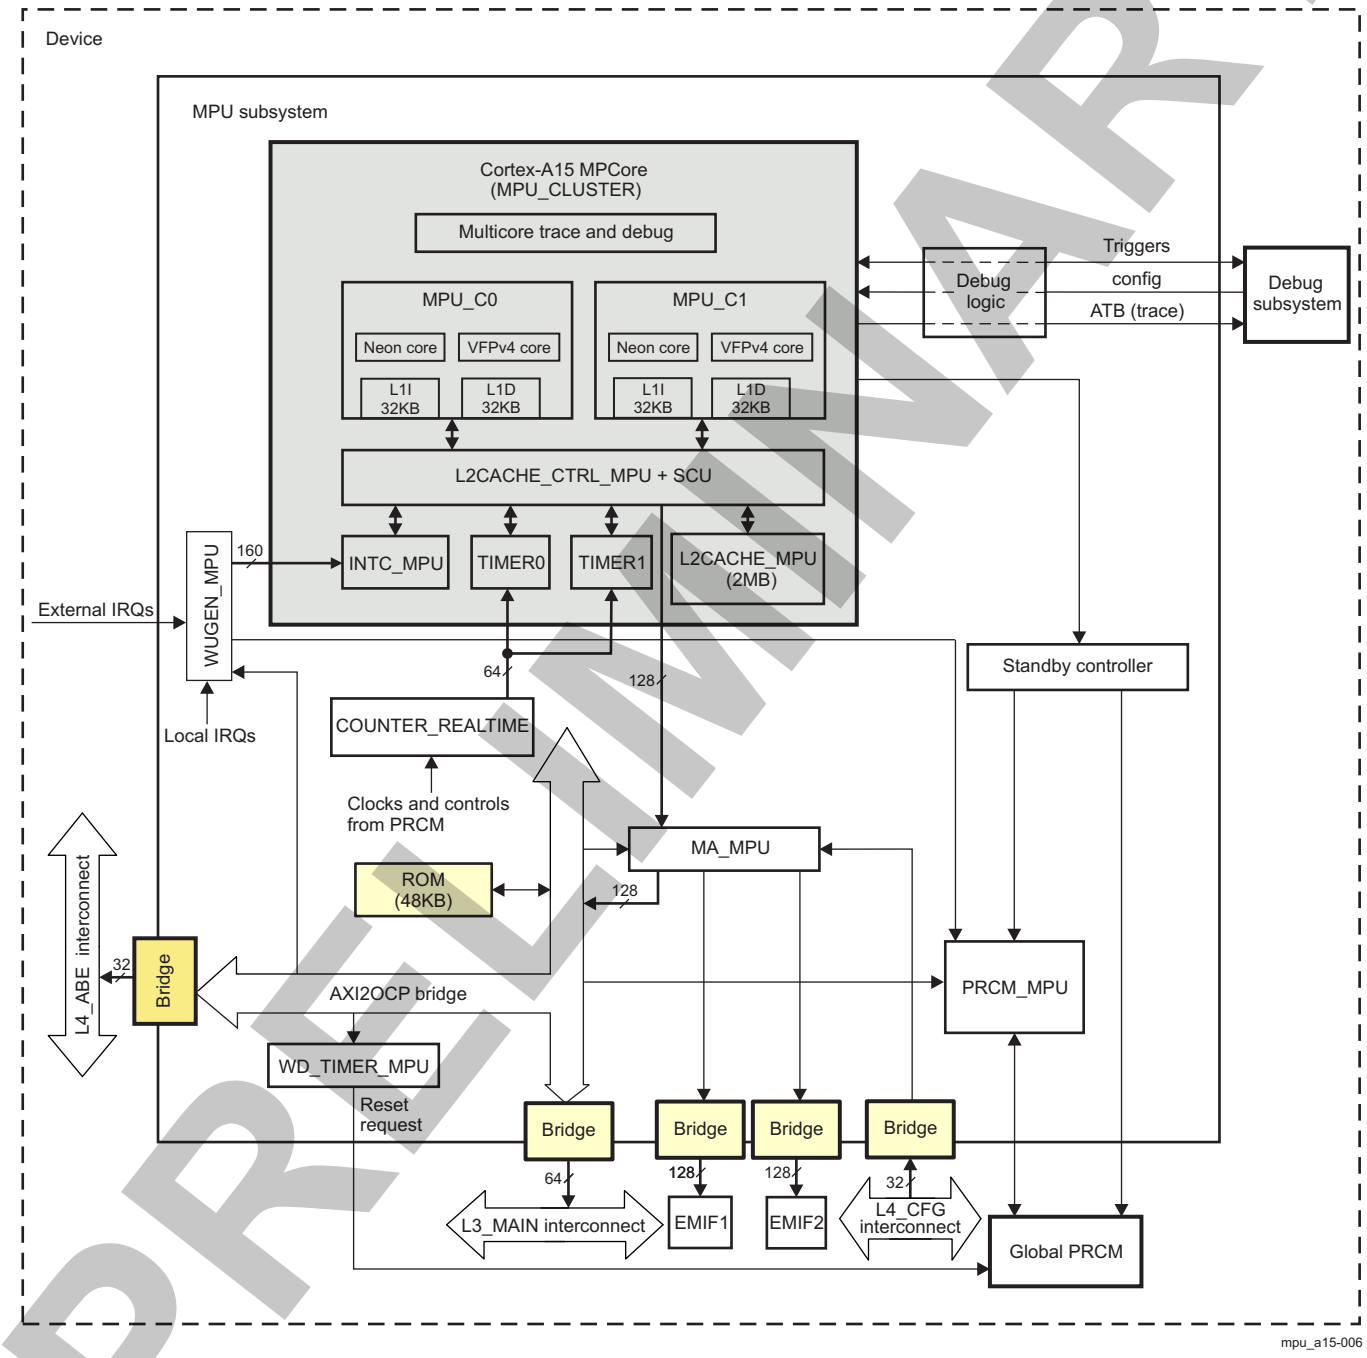
For more information about clocks, resets, and power domains, and the MPU_PWRON_RST and MPU_RST reset signals, see Chapter 3, *Power, Reset, and Clock Management*.

4.3 Dual Cortex-A15 MPU Subsystem Functional Description

4.3.1 MPU Subsystem Block Diagram

Figure 4-5 is the block diagram of the MPU subsystem.

Figure 4-5. MPU Subsystem Block Diagram



4.3.2 Cortex-A15 MPCore (MPU Cluster)

The MPU cluster consists of:

- Two CPUs (dual-core configuration), including:
  - ARM version 7 ISA™: Standard ARM instruction set plus Thumb®-2 , Jazelle® RCT, and Jazelle

DBX Java™ accelerator
  - Neon SIMD coprocessor and VFPv4
  - 12-stage in-order MPU core pipeline
  - 128-bit-wide instruction fetch allows fetching up to four instructions/cycle
  - 32 KiB/32 KiB instruction and data cache for each MPU core
  - Complex Execution Unit (FPU) per MPU core
  - 32-entry fully-associative micro-TLB each for instruction and data per MPU core
  - 512-entry 4-way set-associative unified TLB per MPU core
- Unified L2 cache control including tags
- Interrupt controller (INTC_MPU)
  - Supports 160 hardware interrupts. For more information about interrupt mapping, see Interrupt Controllers.
- One timer and watchdog timer per MPU core
- Internal APB bridge that connects to the APB port of each MPU core

The major interfaces of the MPU cluster are:

- Single AXI master supporting 128-bit interface
- System coherency supported through the AXI4 ACE interface
- An ATB port (for processor trace)
- An APB port
- Interrupt request lines

NOTE: The device supports only the following ACE configurations:
- **AXI3** mode (default). In this configuration, barrier transactions are not issued on the AMBA4 interface.
- **ACE non-coherent, no L3** mode. In this configuration, barrier transactions are issued on the AMBA4 interface.

For more information, see Section 4.3.8, *MPU Subsystem AMBA Interface Configuration*.

NOTE: The MPU subsystem does not implement the ACP port to support hardware coherency with external master.

The MPU subsystem implementation of Cortex-A15 MPCore does not include ECC/parity support for the L1 or L2 caches.

4.3.2.1 MPU L2 Cache Memory System

The MPU subsystem implements an L2 memory system. This memory system consists of an L2 cache and associated L2 cache controller. The MPU L2 cache controller runs at full-CPU speed and is configured to have one 128-bit master port. The L2 cache controller is configurable via CP15 registers and is tightly coupled to the L1 memory system. The MPU L2 memory system supports ARM Instruction Set Architecture (v7).

MPU L2 supports hardware cache coherency, but is used in a limited way in the device. Because the rest of the system does not support coherency with the MPU L2 cache, software coherence is required.

The L2 cache size on the MPU subsystem is 2 MiB. The cache is configured as 16-way set associative, with 64-B line size. The L2 cache controller performs critical word-first-refilling with a random or pseudo-random cache replacement policy.

The L2 includes logic to support cache event monitoring. The events being monitored are routed to the hardware debug (MPUHWDBGOUT[31:0]) port. The mapping of these events to the MPUHWDBGOUT[31:0] port is described in Section 18.4.11.5.1, *MPU Subsystem Observable Signals*, Chapter 18, *Control Module*.

The L2 can be configured to generate interrupts on error conditions or event counter overflow/increment. The L2 interrupt (MPU_CLUSTER_IRQ_AXI) is routed to interrupt line MPU_IRQ_3. When an interrupt occurs, software may look at corresponding interrupt register to determine the source of the interrupt.

4.3.2.1.1 MPU L2 Cache Architecture

The main features of the L2CACHE_MPU are:

- 2048-KiB 16-way set-associative unified instruction/data cache
- 9-stage L2 pipeline
- L2 hit latency of 12 cycles
- Fixed line length of 64-bytes (16 words)
- L1 inclusive
- Physically indexed and tagged
- 16-way set-associative (maximum)
- Bank partitions to support streaming Neon loads and simultaneous (two) L2 requests
- Exclusive-D L2 cache fill policy
- Global-random replacement strategy
- Four dirty bits per cache line to minimize traffic to L3
- Low-leakage sleep mode (retention until accessed)
- Cache redundancy and repair

4.3.2.1.2 MPU L2 Cache Controller

The main features of the L2CACHE_CTRL_MPU are:

- Single 128-bit AXI4 master port interface
- Tightly coupled L2/SCU for better L2 hit latency
- Nonblocking: Supports hit-under-miss and miss-under-miss for Neon requests
- Performs critical data first refilling
- Supports the following cache modes:
  - Write-through, read allocate
  - Write-back, read allocate, and write allocate
- Supports write-combining to two independently tagged quad-words
- 12 × 128-bit write buffers to buffer subblock writes (per MPU core)
- 12 × 128-bit ACP write buffer (shared across MPU cores)
- 16-entry × 512-bit victim buffers (shared across MPU cores)
- Separate 128-bit interfaces to the I-side and the D-side:
  - Four beat (128-bit) transfers to refill L1 from L2 (or 128-bit AXI)
  - Eight beat (64-bit) transfers to refill L1 from AXI
- 128-bit subblock write and copy-back interface on the D-side
- Outstanding transactions on the AXI4 master port:
  - 16 read
  - 16 write
- Performs hardware table walk using the L2 unified TLB

For more information about Cortex-A15 MPCore, see the ARM *Cortex-A15 MPCore Technical Reference Manual* (available at infocenter.arm.com/help/index.jsp).

For more information about debug and emulation features in the MPU subsystem, see Chapter 29, *On-Chip Debug Support*.

4.3.3 AXI2OCP

AXI2OCP provides a protocol bridge between buses and also serves as a small local interconnect to handle traffic to the L3_MAIN interconnect and ABE OCP buses and local configuration registers in the MPU subsystem.

Main features:

- Connects to the L3_MAIN interconnect through a 64-bit port. The interface frequency is configurable between one fourth (default value) and one eighth of the MPU_DPLL_CLK clock signal frequency. This is programmable in the CM_MPU_MPU_CLKCTRL[25:24] CLKSEL_EMIF_DIV_MODE bit.
- Connects to the ABE through a 32-bit port. The interface frequency is configurable between one eighth (default value) and one sixteenth of the MPU_DPLL_CLK clock signal frequency. This is programmable in the CM_MPU_MPU_CLKCTRL[26] CLKSEL_ABE_DIV_MODE bit.
- Connects to the CS_STM module through a 32-bit AXI interface (for software instrumentation)
- Connection to the following modules for register configuration:
  - MA_MPU
  - PRCM_MPU
  - WUGEN_MPU
- Contains internal configuration register related to the MA_MPU function (MA_PRIORITY)
- Supports memory barrier instruction
- Supports single-request-multiple-data (data handshaking) burst mode to pipeline requests
- Supports multiple outstanding requests
- Supports posted and nonposted write transactions, based on the attributes of the transactions coming from the Cortex-A15 processor. Software can override all writes from the local interconnect to the L3 interconnect to be nonposted, regardless of the attributes of the transactions coming from the ARM Cortex-A15 processor, by setting the FORCEWRNP[0] MPUFORCEWRNP bit to 0x1. For the register description, see Chapter 18, *Control Module*.

NOTE: For the description of the CM_MPU_MPU_CLKCTRL register, see Chapter 3, *Power, Reset, and Clock Management*.

4.3.4 Memory Adapter

To decrease the latency of accesses between the MPU L2 cache, and the two EMIF modules, a direct path between the MPU subsystem and the EMIFs is created. To support the direct path between the MPU subsystem and the EMIFs, a memory adapter (MA_MPU) module is instantiated. The MA_MPU splits the incoming (from L2 cache) AXI4 traffic into AXI2OCP and the EMIF accesses. The AXI2OCP accesses are sent to the MA_MPU A2O ports. The EMIF accesses are optionally interleaved between the two EMIF ports. Mandatory firewall checks are performed on all accesses to the EMIFs.

The main features of the MA_MPU are:

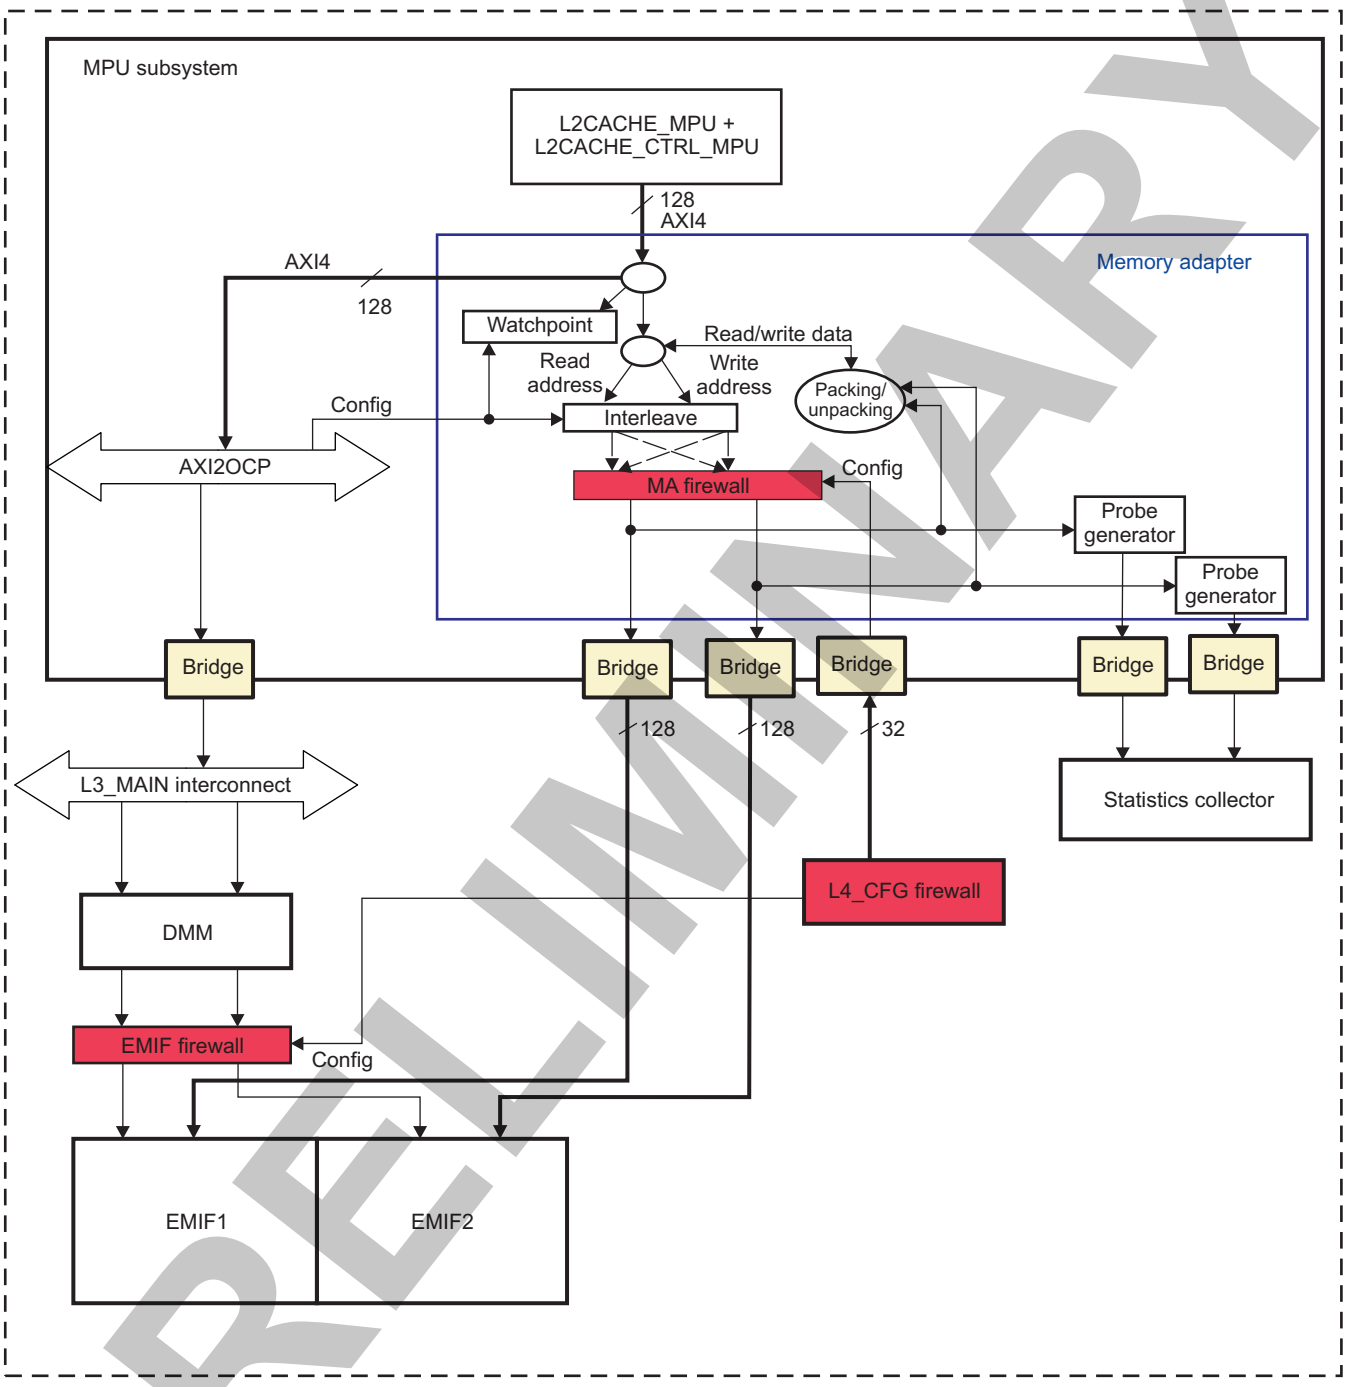
- Splits accesses between the AXI2OCP and the EMIF
- Input from L2 cache and output to AXI2OCP is AMBA4-compatible and runs at Cortex-A15 CPU/2 frequency.
- Supported read response interleaving on A2O port
- Parallel processing of reads and writes
- Support for narrow bursts
- Supports 4 × 128-bit line fills and eviction with critical word first
- Supports barrier instructions on normal read and write channels
- Direct 128-bit interface each to EMIF1 and EMIF2:
  - Single request multiple data
  - No write response on posted writes
- Programmable one-fourth (default value) or one-sixth speed interface to the EMIFs (EMIF1 and

EMIF2). This is selected by the CM_MPU_MPU_CLKCTRL[25:24] CLKSEL_EMIF_DIV_MODE bit.

- Performs interleaving functions to load-balance the activities across the two EMIFs
- Uses firewall logic to check access rights of incoming addresses. The firewall on both EMIFs supports:
  - Configurable number of regions with fixed priority
  - Access support for up to eight execution domains
  - Busy indicator during reconfiguration
- Blocked read and write access to the EMIF for all accesses failing authorization checks
- Burst wrap for single cache line fills
- Supports boot from EMIF space
- Supports 8 GiB of memory
- MA_LSM supports interleaving for 2 GiB of shared memory:
  - Programmable multizone DRAM mapping and interleaving configuration
  - Supports four prioritized sections for defining configuration regions within the external memory
  - Supports interleaving at 128-, 256-, and 512-byte boundaries
- Fixed interleaving for extended 6 GiB of MPU-only memory
- Supports standard disconnect and idle protocols for independent powering down of the MA_MPU and both EMIFs (the EMIF must be powered down or up as a pair)
- Probe interface for performance monitoring of the EMIF ports
- Eleven outstanding reads and 16 outstanding writes
- Supports exclusive accesses used for MPU internal synchronization
- Provides watchpoint capability on AXI bus. For more information, see Chapter 29, *On-Chip Debug Support*.

Figure 4-6 shows the integration of the MA_MPU in the device.

Figure 4-6. MA_MPU Block Diagram



4.3.4.1 MA_MPU Functional Description

4.3.4.1.1 AXI Input Interface

The AXI input is driven from the single external port of the L2 cache. The incoming accesses are directed to the AXI2OCP module through the A2O port or begin their processing for a potential EMIF access. The routing of accesses is based on the AXI address and the EMIF boot input (pi_emifboot).

Table 4-4 lists the AXI access memory mapping. If the accesses are targeted for the AXI2OCP, then they are registered and sent to the A2O port without any alterations in its attributes (size, ID, etc.). The reserved space in the lower order memory area is a result of providing 8 GiB of continuous space for all the nonaliased regions.

The EMIF memory space is broken into eight 1-GiB sections, which are denoted *emif(a)* through *emif(h)*. This partitioning helps to specify the aliasing of several memory ranges. It also aids in the discussion of how the MPU memory space is mapped into the physical EMIF space.

It is expected that the OS uses either the lower 2-GiB space and the lower aliased address of emif(a) and (b), or the continuous 8-GiB space and the upper aliasing of the emif(a) and (b) for all EMIF accesses.

Table 4-4. AXI Access Memory Mapping

Region Name	Start Address	End Address	Interleaving	MA_MPU Action
Boot space	0x00 0000 0000	0x00 000F FFFF	Default	Sent to Firewall/EMIF, if pi_emifboot = 1
			N/A	Sent to A2O port, if pi_emifboot = 0
Non-emif	0x00 0010 0000	0x00 7FFF FFFF	N/A	Sent to A2O port
Emif(a)	0x00 8000 0000	0x00 BFFF FFFF	Programmable	Aliased to address range 0x02 8000 0000–0x02 FFFF FFFF
Emif(b)	0x00 C000 0000	0x00 FFFF FFFF	Programmable	
Reserved	0x01 0000 0000	0x01 FFFF FFFF	N/A	DECERR returned
Emif(c)	0x02 0000 0000	0x02 3FFF FFFF	Fixed	Sent to Firewall/EMIF
Emif(d)	0x02 4000 0000	0x02 7FFF FFFF	Fixed	Sent to Firewall/EMIF
Emif(a)	0x02 8000 0000	0x02 BFFF FFFF	Programmable	Sent to Firewall/EMIF
Emif(b)	0x02 C000 0000	0x02 FFFF FFFF	Programmable	Sent to Firewall/EMIF
Emif(g)	0x03 0000 0000	0x03 3FFF FFFF	Fixed	Sent to Firewall/EMIF
Emif(h)	0x03 4000 0000	0x03 7FFF FFFF	Fixed	Sent to Firewall/EMIF
Emif(e)	0x03 8000 0000	0x03 BFFF FFFF	Fixed	Sent to Firewall/EMIF
Emif(f)	0x03 C000 0000	0x03 FFFF FFFF	Fixed	Sent to Firewall/EMIF
Reserved	0x04 0000 0000	0xFF FFFF FFFF	N/A	DECERR returned

4.3.4.1.2 Interleaving

To load-balance the activities across the two EMIFs, interleaving is used. For the lower 2-GiB address space, which is used by the system and the MPU, a wide range of interleaving options are provided. Because the EMIF memories are accessible by the MPU subsystem through MA_MPU and by the L3_MAIN interconnect through the DMM, the same interleaving scheme must be used in both paths. To ensure compatibility, the interleaving function is implemented by a scaled down version of the LISA Section Manager (LSM), which implements the interleaving function in the DMM.

The high-order memory space, which is accessible only from the MPU subsystem, uses a simple fixed-interleaving scheme, which can be disabled. Heavy use in high memory space under noninterleaved configuration affects the balancing of the system access in lower-order memory.

4.3.4.1.2.1 High-Order Fixed Interleaving Model

The memory address ranges *emif(c)* through *emif(h)* can be interleaved between the two EMIFs by setting the MA_PRIORITY[8] HIMEM_INTERLEAVE_UN bit to 0x1. If enabled, the interleaving occurs on a 256-byte boundary.

Figure 4-7 and Figure 4-8 show how the predefined emif sections are mapped into the EMIF. The LISA configuration can be programmed to allow emif(a) and emif(b) address ranges to be remapped anywhere in EMIF1 or EMIF2. Restricting them to the locations 0x0000 0000–0x7FFF FFFF allows the fully programmable regions to co-exist with the fixed interleaving regions without overlap. Although it is not recommended, the user can program the interleaver to map the emif(a) and emif(b) address ranges to the EMIF 0x8000 0000–0xFFFF FFFF location. If this is done, then additional address aliasing exists between emif sections (a/b) and sections (c) through (h).

NOTE: In fixed interleaving, memory address space 0 is always used.

Figure 4-7. EMIF Partitioning Without High-Order Interleaving

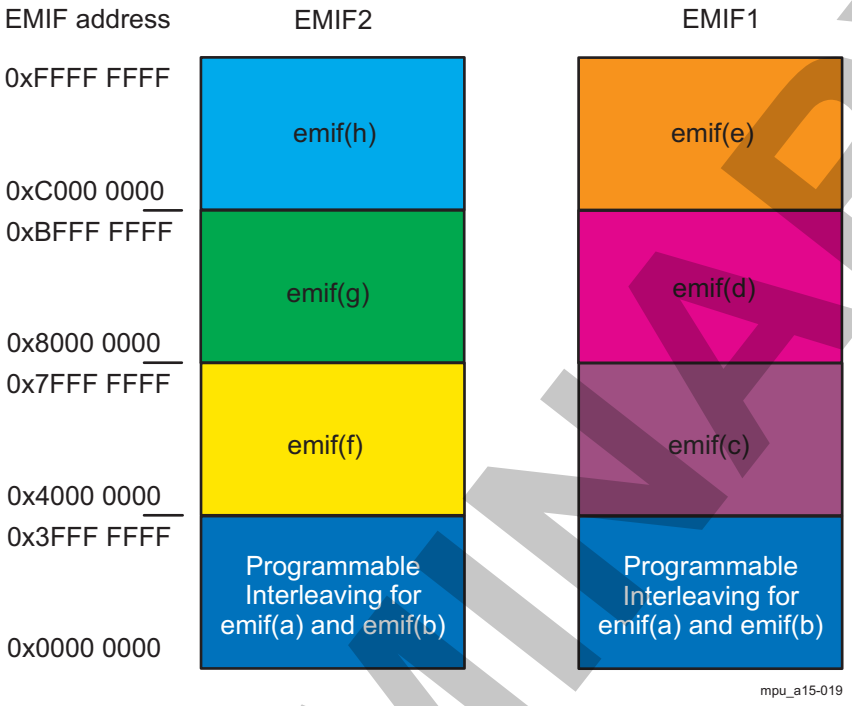


Figure 4-8. EMIF Partitioning With High-Order Interleaving

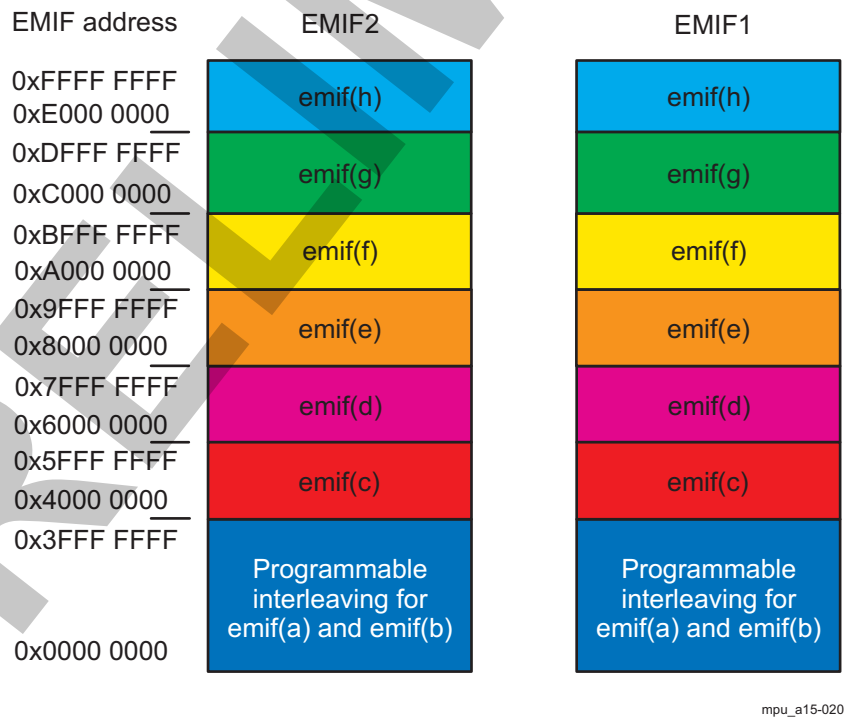


4.3.4.1.2.2 Lower 2-GiB Programmable Interleaving Model

For more information about the lower 2-GiB programmable interleaving model of the MA_LSM, see Dynamic Mapping, and Address Mapping in *Dynamic Memory Manager* chapter. When reading, replace DMM with MA_LSM.

4.3.4.1.2.3 Local Interconnect and Synchronization Agent (LISA) Section Manager

The LSM module in the MA_MPU contains one set of registers and two ports. Each port can handle one address translation, provide the interface size, and determine the EMIF mapping. The two ports process read and write addresses simultaneously. The MA_LSM supports four sections.

4.3.4.1.2.4 MA_LSM Registers

Table 4-5 lists the DMM registers that are duplicated locally in the MA_MPU. These registers have the same names except that DMM is replaced by MA_MPU. Software must keep the content of these registers equal to the content of their counterparts in the DMM.

Table 4-5. MA_MPU Registers Duplicated From the DMM Register Map

Register	Type	Width (Bits)	Base Address
MA_LISA_LOCK	RW	32	0x482A F01C
MA_LISA_MAP_i (where i = 0 to 3)	RW	32	0x482A F040–0x482A F04C

For descriptions of the registers, see *Section 15.2.6, DMM Register Manual*, in Chapter 15, *Memory Subsystem*. The only differences are the following reset values of the MA_LISA_MAP_0 register:

- MA_LISA_MAP_0[22:20] SYS_SIZE = 0x1 (32-MiB section)
- MA_LISA_MAP_0[17:16] SDRC_ADDRSPC = 0x1
- MA_LISA_MAP_0[9:8] SDRC_MAP = 0x1

The configuration of the MA_MPU must be programmed by the Cortex-A15 MPU to match the configuration of the DMM during boot. The registers must be locked after initial programming to avoid corruption by application software. When the SM configuration registers are being programmed, there are no interlocks or safeguards to prevent accesses from being processed at the same time. The MA_LISA_LOCK and MA_LISA_MAP_i registers are retained during power down of retention mode.

If an access is made to a region marked as having unused address space or an unmapped SDRC map, no access is made to the EMIF and an error is returned. If an access is made to a region marked as accesses-SDRC-internal-registers, no access occurs to the EMIF and an error is returned. This is because the internal registers are not accessible from this port.

If an access is made to a region that is not mapped to any LISA section, or selects a section with one of the following programmations, then no access is made to the EMIF and an error is returned on the AXI port:

- SDRC_MAP field equal to UNMAPPED
- SDRC_ADDRSPC field equal to INTERNAL REGISTER
- SDRC_ADDRSPC field equal to UNUSED

4.3.4.1.2.5 Posted and Nonposted Writes

On posted writes, a response is returned after all write data is accepted by the MA_MPU and one of the following occurs:

- The request is canceled, because of an interleaving error.
- The request is pushed into the firewall FIFO.

On nonposted writes, a response is not returned until after all write data is accepted by the MA_MPU and one of the following occurs:

- The request is canceled, because of an interleaving error.

- The request has a firewall violation.
- The associated response is received from the EMIF (access is completed in the EMIF).

When the FORCEWRNP[0] MPUFORCEWRNP bit is set to 0x1, all writes are forced to be converted to nonposted writes (prevents posted writes).

4.3.4.1.2.6 Errors

If the region is marked as unmapped, o targets EMIF internal registers or reserved space, access is blocked and an error response is returned. Such an error occurs on the first half of a potential split access and aborts the entire access at that time. DECERR errors ultimately generate ARM aborts. See the ARM Fault Status Register for more information.

To avoid undefined results, the following program rules must be followed:

- A section cannot be mapped as interleaving (MA_LISA_MAP_i[9:8] SDRC_MAP = 0x3), and the MA_LISA_MAP_i[19:18] SDRC_INTL bit field must be equal to 0x0.
- If the section maps to a single EMIF (MA_LISA_MAP_i[9:8] SDRC_MAP = 0x1 or 0x2), the MA_LISA_MAP_i[7:0] SDRC_ADDR bit field must be aligned to the MA_LISA_MAP_i[22:20] SYS_SIZE bit field (that is, the lower SDRC_ADDR bits must be 0).
- If the section maps to both EMIFs (MA_LISA_MAP_i[9:8] SDRC_MAP = 0x3), the MA_LISA_MAP_i[7:0] SDRC_ADDR bit field must be aligned to MA_LISA_MAP_i[22:20] SYS_SIZE – 1, because the addressable space for each EMIF is half.
- If the section maps to both EMIFs (MA_LISA_MAP_i[9:8] SDRC_MAP = 0x3), the MA_LISA_MAP_i[22:20] SYS_SIZE bit field cannot be 0.

4.3.4.1.3 Statistics Collector Probe Ports

To enable performance monitoring by the debug subsystem, a subset of interconnect signals must be monitored and sent to a statistics collector in the CORE domain. For more information about the statistics collector, see Chapter 29, *On-Chip Debug Support*.

4.3.4.1.4 MA_MPU Firewall

A firewall exists between the interleaving logic and each EMIF port. The firewall checks the address and access qualifiers against the permission attributes for the highest priority region to which the address belongs. If the access fails to get permission, a violation occurs and the fw_func_error or fw_debug_error output is asserted. The failing access is blocked and a slave error response is returned on the MA_MPU port for read and nonposted accesses. For more information about the MA_MPU firewall, see Chapter 14, *Interconnect*.

4.3.4.1.5 MA_MPU Power and Reset Management

The MA_MPU supports a power-down state where the MA_LSM and firewall configurations are retained.

The MA_LSM supports only smart-idle mode.

4.3.5 Realtime Counter (Master Counter)

The realtime counter (COUNTER_REALTIME), also called master counter, is a free-running counter, which is related to real time. It produces the count used by the private timer peripherals in the MPU cluster. The timer counts at a rate of 6.144 million counts per second. Because the device operates on different clocks in different power modes, the master counter shifts operation between clocks, adjusting the increment per clock accordingly to maintain a constant count rate.

COUNTER_REALTIME runs on the PRCM_MPU clock coming from the global PRCM (WKUPAON_ICLK). The two sources for this clock are:

- SYS_CLK: System clock from external source. The supported frequencies are 12, 13, 19.2, 26, 27, and 38.4 MHz.
- ABE_LP_CLK: Clock derived from DPLL_ABE, used in some low-power use cases, runs at 12.288 MHz (DPLL cascading)

When the MPU subsystem goes to standby mode, the counter automatically switches to a low-power mode using the 32-kHz clock (FUNC_32K_CLK).

Table 4-6 shows the counter increment value for different counter clock frequencies and corresponding register programming.

Table 4-6. COUNTER_REALTIME Increment Values

COUNTER_ REALTIME Clock Mode	COUNTER_ REALTIME Clock Name	COUNTER_ REALTIME Clock Frequencies	COUNTER_ REALTIME Increment Value	PRCM_MPU Register Programming
System (SYS)	SYS_CLK, MHz	12	64 / 125	PRM_FRAC_INCREMENTER_NUMERATOR [11:0] SYS_MODE_NUMERATOR divided by PRM_FRAC_INCREMENTER_DENUMERATOR_ RELOAD [11:0] DENOMINATOR
		13	768 / 1625	
		19.2	8 / 25	
		26	384 / 1625	
		27	256 / 1125	
		38.4	4 / 25	
ABE Low-Power (ABE_LP)	ABE_LP_CLK, MHz	12.288	1 / 2	PRM_FRAC_INCREMENTER_NUMERATOR [27:16] ABE_LP_MODE_NUMERATOR divided by PRM_FRAC_INCREMENTER_DENUMERATOR_ RELOAD [11:0] DENOMINATOR
Low-Power (LP)	FUNC_32K_CLK, Hz	32 768	375 / 2	PRM_FRAC_INCREMENTER_DENUMERATOR_ RELOAD [16] RELOAD

4.3.5.1 Frequency Change Procedure

The change between the system clock (SYS_CLK) and the ABE low-power clock (ABE_LP_CLK) is performed within global PRCM. A software-controllable bit (CM_CLKSEL_WKUPAON[0] CLKSEL) controls this change. A glitch-free clock multiplexer produces the resulting clock (WKUPAON_ICLK), which is used as the functional clock of the master counter. The CM_CLKSEL_WKUPAON[0] CLKSEL bit is exported from global PRCM to the master counter to control simultaneously the mode (SYS or ABE_LP).

The transition from SYS to ABE_LP mode (DPLL cascading entry) is done under software control as follows:

- DPLL_ABE must be locked before (under software control, global PRCM register CM_CLKMODE_DPLL_ABE[2:0] DPLL_EN = 0x7).
- Software writes 1 in the global PRCM register CM_CLKSEL_WKUPAON[0] CLKSEL bit to choose DPLL_ABE clock.

The transition from ABE_LP to SYS mode (DPLL cascading exit) is done under software control as follows:

- Software writes 0 in the global PRCM register CM_CLKSEL_WKUPAON[0] CLKSEL bit to choose SYS CLK.
- DPLL_ABE may be unlocked after.

Transition from FUNC (ABE_LP or SYS) to LP mode is done by hardware upon MPU subsystem standby entry sequence.

Transition from LP to FUNC (ABE_LP or SYS) mode is done by hardware upon MPU subsystem standby exit sequence.

The frequency change involves some uncertainty on the counter due to a glitch-free clock MUX in global PRCM. In order not to accumulate them, a free-running coarse counter on the FUNC_32K_CLK clock holds the reference count, used for realignment when necessary. To load and reload the reference count value (375/2) from the coarse counter, the user must write 1 in the PRM_FRAC_INCREMENTER_DENUMERATOR_RELOAD[16] RELOAD bit (but it must be 0 before doing that).

Once configured (at first boot time), the counter is running in all modes without any action required by software.

4.3.6 MPU Watchdog Timer

The MPU watchdog timer (WD_TIMER_MPU) implements two channels, one per MPU core (WD_TIMER_MPU_C0 and WD_TIMER_MPU_C1, respectively; an unified name WD_TIMER_MPU_Cx is used hereafter in the chapter). The WD_TIMER_MPU operates on MPU subsystem clock (MPU_DPLL_CLK).

Each WD_TIMER_MPU_Cx channel implements:

- A 32-bit decrementing counter which has a period set by the value loaded into the counter (via the WDT_LOAD_REGISTER_i[31:0] NEWCOUNT bit field) and the prescaler ratio (set via the WDT_PRESCALER_REGISTER[9:0] PRESCALER bit field). The period is calculated as follows: $T_{WD\_TIMER\_MPU\_Cx}$ = (PRESCALER + 1) x (NEWCOUNT + 1) / f(MPU_DPLL_CLK).
- Two interrupt output signals (WARN, INTR)
- One reset request output (MPUSSRST)

The counter starts decrementing when the WDT_CONTROL_REGISTER_i[0] ENABLE bit is set to 0x1. The current count value can be monitored by reading the WDT_COUNT_REGISTER_i[31:0] CURRENTCOUNT bit field. When the counter reaches zero, a timeout condition occurs. In the timeout condition, the counter stops counting and:

- WD_TIMER_MPU_Cx_IRQ interrupt is generated to the INTC_MPU, if enabled by setting the WDT_CONTROL_REGISTER_i[1] INTREN bit to 0x1.
- Reset request is generated to the global PRCM, if enabled by setting the WDT_CONTROL_REGISTER_i[3] MPUSSRSTEN bit to 0x1.

NOTE: If the MPU core corresponding to the WD_TIMER_MPU_Cx channel is in debug state, the counter does not decrement until the MPU core returns to non-debug state. Debug state is inferred by monitoring the DBGACK signal corresponding to this core.

Additionally, the user can also setup a warning condition which can be used to signal an interrupt that gives software a notice when the WD_TIMER_MPU_Cx is getting close to a timeout. The threshold value is set in the WDT_WARNING_REGISTER_i[31:0] WARNING_WATERMARK bit field. The current count value is then compared to the threshold (warning watermark) level value and when CURRENTCOUNT = WARNING_WATERMARK, a warning interrupt (WD_TIMER_MPU_Cx_IRQ_WARN) is generated to the INTC_MPU (if enabled by setting the WDT_CONTROL_REGISTER_i[1] WARNEN bit to 0x1).

The mapping of the four WD_TIMER_MPU interrupts is as follows:

- WD_TIMER_MPU_C0_IRQ_WARN mapped to MPU_IRQ_4
- WD_TIMER_MPU_C1_IRQ_WARN mapped to MPU_IRQ_5
- WD_TIMER_MPU_C0_IRQ mapped to MPU_IRQ_139
- WD_TIMER_MPU_C1_IRQ mapped to MPU_IRQ_140

The user can also poll the following status bits:

- WDT_RESET_STATUS_REGISTER_i[0] TO, to know when the timeout condition has occured. This bit might also be used to figure out which WD_TIMER_MPU_Cx signalled a reset request.
- WDT_RESET_STATUS_REGISTER_i[1] WARN, to know when the warning condition has occured.

The following programming guidelines should be taken into account:

- The WDT_PRESCALER_REGISTER_i register should be written (if needed) before the WDT_LOAD_REGISTER_i register is written. This is because when the WDT_LOAD_REGISTER_i register is written, the WDT_COUNT_REGISTER_i register is immediately updated with this value and at the same time, the PRESCALER value is sampled to be used by the decrement logic which controls the WDT_COUNT_REGISTER_i register.
- The WDT_WARNING_REGISTER_i and WDT_LOAD_REGISTER_i registers should be written before the WD_TIMER_MPU_Cx is enabled (WDT_CONTROL_REGISTER_i[0] ENABLE = 0x1). Otherwise, interrupts and reset request may be asserted immediately depending on the state of these registers.

For example, after reset these registers have '0' and if the WDT_CONTROL_REGISTER register is configured to enable the corresponding interrupts and reset request, and then WD_TIMER_MPU_Cx is enabled, interrupts and reset request are immediately asserted.

The suggested programming order is as follows:

1. Set the warning watermark level (WDT_WARNING_REGISTER_i), if needed
2. Set the prescaler ratio (WDT_PRESCALER_REGISTER_i[9:0] PRESCALER)
3. Set the new count value (WDT_LOAD_REGISTER_i)
4. Enable corresponding interrupts and reset request in WDT_CONTROL_REGISTER_i, if needed
5. Enable WD_TIMER_MPU_Cx (WDT_CONTROL_REGISTER_i[0] ENABLE = 0x1)

NOTE: When the MPU cores are going to low power state, the WD_TIMER_MPU may need to be disabled. If it is not disabled, then the WD_TIMER_MPU may timeout (since the MPU core is not refreshing the timeout counters) and will generate MPUSS reset request which will reset the MPU domain, including both MPU cores.

4.3.7 MPU Subsystem Power Management

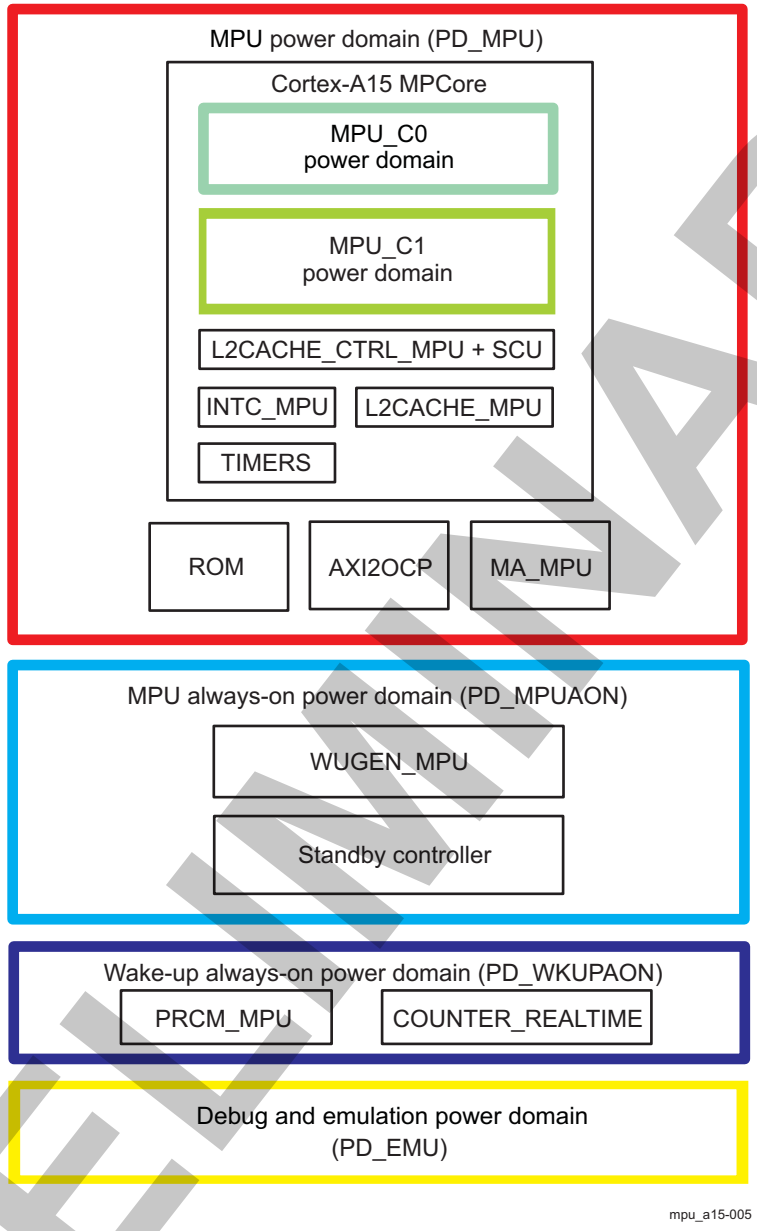
The MPU subsystem implements a local PRCM (PRCM_MPU) module to handle the local Cortex-A15 CPU power domains, along with the corresponding L1 cache. The PRCM_MPU module includes two power-management control (PSCON) modules to control the power chains for MPU_C0 and MPU_C1. The PRM_PSCON_COUNT register is used for that control purpose.

In addition to the standard power-management technique supported in the device, the MPU subsystem also employs an SR3-APG (automatic power gating) power-management technology to reduce leakage. This technology allows for full logic and memories retention on MPU_C0 and MPU_C1 and is controlled by the PRCM_MPU. The SR3-APG power-management can be enabled by setting the PRM_PSCON_COUNT[24] HG_EN bit. For more information about how to enable SR3-APG fast-wakeup, see Section 4.3.7.6, *SR3-APG Technology Fail-Safe Mode*.

4.3.7.1 Power Domains

The MPU subsystem is divided into six power domains controlled by the local or global PRCM module, as shown in Figure 4-9.

Figure 4-9. MPU Subsystem Power Domains Overview



NOTE: The MPU debug and trace modules are implemented in various power domains. For more information, see Chapter 29, *On-Chip Debug Support*.

The device-level power domains are directly aligned with voltage domains and thus can be represented as a cross-reference to the different voltage domains.

For information about the physical power domains (PD_MPU, PD_MPUAON, PD_WKUPAON, and PD_EMU) and the related voltage domains, see Chapter 3, *Power, Reset, and Clock Management*.

4.3.7.2 Power States of MPU_Cx

MPU_Cx (where x = 0 or 1) changes power states only when the StandbyWFI signal is asserted. There is no signal coming from the MPU cores, or the MPU cluster to define in which power state MPU_Cx can go. Software must program such information by writing to the PM_CPUx_PWRSTCTRL[1:0] POWERSTATE bit field before executing the WFI instruction. Table 4-7 provides the software requirements before executing the WFI instruction, and the condition to return to run mode.

Table 4-7. MPU_Cx State Transitions

Low-Power State	Software Sequence Before Executing WFI	Wakeup (Transition Back to Run Mode)
WFI/ON Logic ON L1$ ON	Execute a Data Synchronization Barrier (DSB) instruction.	Managed locally to MPU_Cx upon one of the following sources: • An interrupt, masked or unmasked (important: masked does not mean disabled) • An imprecise data abort, regardless of the value of the CPSRA bit • A debug request generated by writing 1 to the HALTING DEBUG MODE bit of the Cortex-A15 DBGSCR register, or the assertion of the Cortex-A15 EDBGRQ pin • Global device cold or warm reset source
WFI/INACT Logic ON L1$ ON	Execute a DSB instruction.	Managed locally by PRCM_MPU upon following source: • An interrupt, enabled at WUGEN_MPU level • A forced wakeup (sw_wkup) • A full debug wake-up request sequence: ForceActive from the DAP_PC, a debug request (as explained previously), assert block reset, wait for processor to halt and clear the block reset • Global device cold or warm reset source
WFI/RETENTION Logic RET L1$ ON L1$ peripheral OFF	1. Set the PM_CPUx_PWRSTCTRL[1:0] POWERSTATE bit field to 0x1 (RETENTION state). 2. Execute a DSB instruction.	Managed locally by PRCM_MPU upon following source: • An interrupt, enabled at WUGEN_MPU level • A forced wakeup (sw_wkup) • A full debug wake-up request sequence: ForceActive from the DAP_PC, a debug request (as explained previously), assert block reset, wait for processor to halt and clear the block reset • Global device cold or warm reset source PRCM_MPU does not need to reset MPU_Cx.

Table 4-7. MPU_Cx State Transitions (continued)

Low-Power State	Software Sequence Before Executing WFI	Wakeup (Transition Back to Run Mode)
WFI/OFF Logic OFF L1$ OFF	1. Save INTC_MPU configuration for MPU_Cx interrupts. 2. Disable SGI and PPI toward MPU_Cx in INTC_MPU. 3. Save all ARM registers, including CPSR and SPSR. 4. Save all CP15 registers. 5. Save all debug-related states. 6. Set the PM_CPUx_PWRSTCTRL[1:0] POWERSTATE bit field to 0x0 (OFF state). 7. Clear the C-bit in the SCTLR to prevent further data cache allocation. 8. Clean/invalidate L1$ content on an as-needed basis. 9. Execute an Instruction Synchronization Barrier (ISB) instruction to ensure that all of the above CP15 register changes have been committed. 10. Execute a DSB instruction.	Managed locally by PRCM_MPU upon following source: • An interrupt, enabled at WUGEN_MPU level • A forced wakeup (sw_wkup) • A full debug wake-up request sequence (as previously mentioned) • Global device cold or warm reset source PRCM_MPU must reset MPU_Cx to make it reboot and restore its context, including INTC_MPU.
WFI/FORCED_OFF[(1)] Logic OFF L1$ OFF	1. Save INTC_MPU configuration for MPU_C1 interrupts. 2. Disable SGI and PPI toward MPU_C1 in INTC_MPU. 3. Save all ARM registers, including CPSR and SPSR. 4. Save all CP15 registers. 5. Save all debug-related states. 6. Set the PM_CPU1_PWRSTCTRL[1:0] POWERSTATE bit field to 0x0 (OFF state). 7. Set the PM_CPU1_PWRSTCTRL[7] FORCED_OFF bit to 0x1. 8. Clear the C-bit in the SCTLR to prevent further data cache allocation. 9. Clean/invalidate L1$ content on an as-needed basis. 10. Clear SMP bit to take CPU out of coherency. 11. Execute an ISB instruction to ensure that all of the above CP15 register changes have been committed. 12. Execute a DSB instruction.	Managed locally by PRCM_MPU upon following source: • A forced wakeup (sw_wkup) • A full debug wake-up request sequence (as previously mentioned). Block reset is not supported. • Global device cold or warm reset source PRCM_MPU must reset MPU_Cx to make it reboot and restore its context, including INTC_MPU.

(1) Applies to MPU_C1 only.

NOTE: For the description of the Cortex-A15 CPU registers and the DSB/ISB instructions, see the ARM *Cortex-A15 Technical Reference Manual* (available at infocenter.arm.com/help/index.jsp).

The RETENTION low-power state is not natively supported by the MPU cluster. This mode is implemented with SR3-APG power-management technology. The MPU subsystem power-management hardware is designed to ensure that the system does not have an L1 cache coherency problem when putting both MPU cores in retention mode. In this mode, the MPU_Cx logic is in full retention with all memory content preserved by keeping the array of memories fully powered and the logic of the memory peripheries shut down. In slow wake-up mode, memories are put into retention to prevent more leakage.

In OFF and RETENTION low-power states, the standby controller gates the clock to the MPU cluster by deasserting the CLKEN signal before signaling the PRCM_MPU to perform a power transition. In these low-power states, the MPU core can be wakened only by the PRCM_MPU. A number of important actions must be performed by software before entering such a state.

FORCED_OFF mode applies only to MPU_C1. In this mode, it is critically important for software to clear the SMP bit of the targeted MPU core to take that MPU core out of coherency and to prevent TLB, BTB, or instruction cache maintenance operations from other MPU core in the cluster being issued to this MPU core. The SMP bit is part of the Auxiliary Control Register (ACTLR); there is one ACTLR per MPU core. The ACTLR is a CP15 register. For more information about this register, see the ARM *Cortex-A15 Technical Reference Manual* (available at infocenter.arm.com/help/index.jsp).

A wakeup from OFF low-power state must always happen through a MPU core reset so that the MPU core restores its state to the same level as before the power transition before handling the wake-up event itself (the interrupt). A wakeup from RETENTION low-power state does not need to happen through a MPU core reset because MPU core logics are fully retained.

NOTE: The private peripheral interrupts (PPIs) cannot wake up an MPU core in INACT, RETENTION, or OFF low-power state. Software-generated interrupts (SGI) cannot wake up an MPU core in the same low-power state. However, it is possible to work around the issue by applying the following method:

- When MPU_Cx wants to send an SGI to MPU_Cy (that is, the other MPU core), it must first systematically set the CM_CPUy_CLKSTCTRL[1:0] CLKTRCTRL bit field to 0x2 (software-forced wake-up transition),
- The MPU_Cy corresponding ISR must write back the CM_CPUy_CLKSTCTRL[1:0] CLKTRCTRL bit field to 0x3 (HW_AUTO, automatic transition).

Table 4-8 gives details of the power state of the supported MPU_Cx and the corresponding values of the PRCM_MPU register.

Table 4-8. MPU_Cx Supported Power States

Hardware Conditions		MPU_Cx Programming Model		Resulting MPU_Cx State			
StandbyWFI StandbyWFE	**State of L2/Other MPU core**	**PRCM_MPU Power State PM_CPUx_PWRSTCTRL[1:0] POWERSTATE**	**PRCM_MPU Clock Transition Control CM_CPUx_CLKSTCTRL[1:0] CLKTRCTRL**	**Logic**	**L1 Cache**	**ARM Cortex-A15 Internal Clock Gating**	**Power State at PRCM_MPU**
MPU_Cx running	Any	Any	Any	ON	ON	ON	ON
MPU_Cx in WFE	Any	Any	Any	ON	ON	OFF	ON
MPU_Cx in WFI	Any	Any	NO_SLEEP/SW_WKUP	ON	ON	OFF	ON
MPU_Cx in WFI	Any	ON	HW_AUTO	ON	ON	OFF	ON
MPU_C1 in WFI	Any	FORCED_OFF(1)	HW_AUTO	OFF	OFF	OFF	OFF
MPU_Cx in WFI	!= (IDLE/WFI/WFI)	Any	HW_AUTO	ON	ON	OFF	ON
MPU_Cx in WFI	IDLE/WFI/WFI	INACT	HW_AUTO	ON	ON	OFF	INACT
MPU_Cx in WFI	IDLE/WFI/WFI	RETENTION	HW_AUTO	SR3-APG/ON(2)	ON/RETENTION(3)	OFF	CSWRET

(1) FORCED_OFF mode applies only to MPU_C1. See Table 4-7 for the guidelines about how to enter FORCED_OFF mode.

(2) If PRM_PSCON_COUNT[24] HG_EN = 1, MPU core logic is put in SR3-APG state. If not, MPU core logic is kept ON.

(3) L1$ state depends on the values of the PRM_PSCON_COUNT[25] HG_RAMPUP and PRM_PSCON_COUNT[24] HG_EN bits. When CPU PD is in the CSWRET state, if HG_ENABLE = 0x1 and HG_RAMPUP = 0x1, then L1$ memory is in ON state, else L1$ memory is in the RETENTION state. For more information, see Section 4.3.7.6, *SR3-APG Technology Fail-Safe Mode*.

Table 4-8. MPU_Cx Supported Power States (continued)

Hardware Conditions		MPU_Cx Programming Model		Resulting MPU_Cx State			
StandbyWFI StandbyWFE	State of L2/Other MPU core	PRCM_MPU Power State PM_CPUx_PWRSTCTRL[1:0] POWERSTATE	PRCM_MPU Clock Transition Control CM_CPUx_CLKSTCTRL[1:0] CLKTRCTRL	Logic	L1 Cache	ARM Cortex-A15 Internal Clock Gating	Power State at PRCM_MPU
MPU_Cx in WFI	IDLE/WFI/WFI	OFF[4]	HW_AUTO	OFF	OFF	OFF	OFF
MPU_Cx in WFI	Any	OFF[5]	HW_AUTO	OFF	OFF	OFF	OFF

(4) ES1 OFF mode. See the note below for details.
(5) ES2 OFF mode. See the note below for details.

NOTE: The behavior of the OFF mode is different between ES1 and ES2:

- ES1 mode (AMBA_IF_MODE[5] ES2_PM_MODE = 0x0): MPU cores would enter and exit OFF mode together. This is the default mode.
- ES2 mode (AMBA_IF_MODE[5] ES2_PM_MODE = 0x1): MPU cores are allowed to enter/exit OFF mode independently.

The AMBA_IF_MODE[5] ES2_PM_MODE bit is a static bit that should not be changed dynamically.

The ROM code provides specific API for configuring the AMBA_IF_MODE register. For more information, see Section 28.4.3, *Wakeup Generator*, in Chapter 28, *Initialization*.

The PM_CPUx_PWRSTCTRL register is static over any power transition. That is, software programs it before executing the WFI instruction and does not change it until MPU_Cx is again in running mode. In other words, when MPU_Cx reaches a low-power state, it cannot move to another low-power state. It must be woken up to reach another low-power state. To wake up MPU_Cx, the user must:

1. Execute a forced wake-up transition to the MPU_Cx: CM_CPUx_CLKSTCTRL[1:0] CLKTRCTRL = 0x2.
2. The MPU_Cx interrupt handler must write back the automatic hardware transition: CM_CPUx_CLKSTCTRL[1:0] CLKTRCTRL = 0x3.

Table 4-9 shows the available MPU_Cx power states in single and coherency mode. For coherency, software must ensure that both MPU cores are in the same power state.

Table 4-9. Available MPU_Cx Power States in Single and Coherency Mode

MPU_C0 Power State	MPU_C1 Power State	Mode
Running/ON or WFI/ON	Running/ON or WFI/ON	SMP mode (coherent mode)
WFI/INACT	WFI/INACT	
WFI/CSWRET	WFI/CSWRET	
WFI/OFF[1]	WFI/OFF[1]	
WFI/OFF[2]	Any state[2]	
Any state[2]	WFI/OFF[2]	
Running/ON or WFI/ON	OFF (Forced-off)	Single mode (MPU_C1 is out of coherency)
WFI/INACT	OFF (Forced-off)	
WFI/CSWRET	OFF (Forced-off)	
WFI/OFF	OFF (Forced-off)	

(1) Valid for ES1 PM mode (AMBA_IF_MODE[5] ES2_PM_MODE = 0x0).
(2) Valid for ES2 PM mode (AMBA_IF_MODE[5] ES2_PM_MODE = 0x1).

4.3.7.3 Power States of MPU Subsystem

The MPU subsystem power domain (PD_MPU) must be at a higher or equal power state (a state that consumes more power) than the higher of the two MPU cores. For example, it is illegal for the MPU subsystem power state to be OFF, while the power state of one or both of the MPU cores is RETENTION. Software must ensure that only legal power states are programmed. When an illegal state is entered, the behavior of the hardware is unpredictable.

Table 4-10 lists the MPU subsystem legal power states.

Table 4-10. MPU Subsystem Legal Power States

Hardware Conditions		MPU/System Programming Model				Resulting MPU/System State			
MPU_Cx States	State of L2	PRCM Power State PM_MPU_PWRSTCTRL[1:0] POWERSTATE	PRCM Logic Retention State PM_MPU_PWRSTCTRL[2] LOGICRETSTATE	PRCM L2 Memory Retention State PM_MPU_PWRSTCTRL[9] MPU_L2_RETSTATE	PRCM Clock Transition Control CM_MPU_CLKSTCTRL[1:0] CLKTRCTRL	Logic	L2 Cache	DPLL Clock	Power State (at PRCM)
At least one is ON	Any	Any	Any	Any	Any	ON	ON	ON	ON
Any	!= (IDLE / WFI)	Any	Any	Any	Any	ON	ON	ON	ON
Power state of both MPU cores is less than or equal to INACT	IDLE / WFI	Any	Any	Any	NO_SLEEP/SW_WKUP	ON	ON	ON	ON
	IDLE / WFI	ON	Any	Any	HW_AUTO	ON	ON	ON	ON
	IDLE / WFI	INACT	Any	Any	HW_AUTO	ON	ON	OFF	INACT
Power state of both MPU cores is less than or equal to CSWRET	IDLE / WFI	RETENTION	CSWRET	RETENTION	HW_AUTO	ON	RETENTION	OFF	CSWRET

NOTE: All the transitions presented in Table 4-10, except for the first line, are handled by the PRCM_MPU and the global PRCM.

Once the MPU subsystem reaches a low-power state (INACT, CSWRET, OFF), it cannot move to another low-power state. It must be woken up to reach another low-power state.

4.3.7.4 WUGEN_MPU

The WUGEN_MPU belongs to the MPU always-on power domain (PD_MPUAON) and is responsible for generating wake-up events from the incoming interrupts (external and local to the MPU subsystem) according to the WUGEN_MPU 160-bit enable field (from WKG_ENB_A_x to WKG_ENB_E_x for MPU_Cx, where x = 0 or 1), which defines the interrupt that wakes up the MPU cores. Note that each MPU core cannot be independently wakened by interrupts. Instead, an enabled interrupt wakes up both MPU cores (except if MPU_C1 is in FORCED_OFF state). Therefore, the WUGEN_MPU is designed to handle interrupts for both MPU cores and generates a single wake-up request signal to the standby controller.

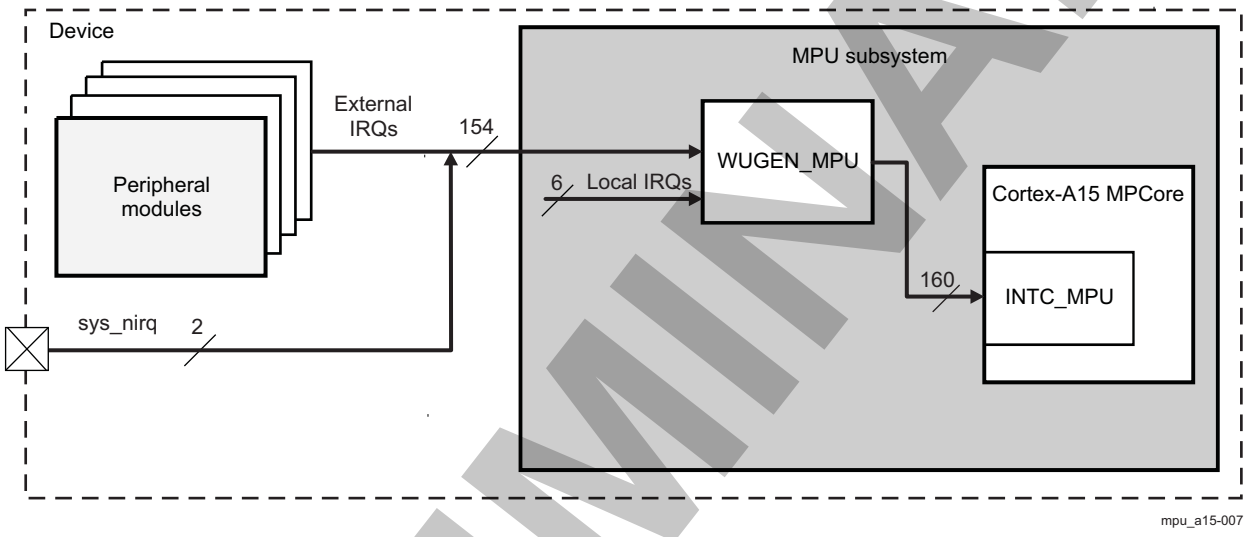
All interrupts are enabled after reset, except MPU_IRQ_8 (which is not supported by the GP device). The Cortex-A15 MPU can access the WUGEN_MPU internal configuration registers through the AXI2OCP.

Software must program interrupt enabling and disabling coherently in the INTC_MPU and in the WUGEN_MPU enable registers. That is, a given interrupt for a given MPU core is either enabled at both INTC_MPU and WUGEN_MPU, or disabled at both; no combination is allowed.

WUGEN_MPU includes two registers (AUX_CORE_BOOT0 and AUX_CORE_BOOT1) which can be used by the ROM code and OS during SMP boot. The AUX_CORE_BOOT0 register is intended to indicate boot status to either cores; the AUX_CORE_BOOT1 register can be used to store execution start address of the second core (also known as aux core). For more information, see Chapter 28, *Initialization*.

Figure 4-10 is a functional overview of the WUGEN_MPU in the MPU subsystem.

Figure 4-10. WUGEN_MPU Overview



4.3.7.5 Power Transition Sequence

At power-on-reset (POR), or global warm reset, both MPU cores are powered on. Software can determine the appropriate power mode for both MPU cores and program the PRCM_MPU accordingly.

There are three types of power transitions:

- Power transitions that do not involve the local or global PRCM module
  - MPU_Cx transition to WFE/ON - corresponds to line 2 of Table 4-8
  - MPU_Cx transition to WFI/ON - corresponds to lines 3, 4, and 6 of Table 4-8
- Power transitions handled by the local PRCM module
  - MPU_C1 transition to WFI/FORCED_OFF - corresponds to line 5 of Table 4-8. Requires software to program PRCM_MPU with FORCED_OFF mode.
  - MPU_Cx transition to WFI/INACT, WFI/RET or WFI/OFF - corresponds to line 7, 8 and 9 of Table 4-8. Requires software to program the PRCM_MPU with INACT/RET/OFF mode.
- Power transitions handled by the local and global PRCM modules

4.3.7.6 SR3-APG Technology Fail-Safe Mode

The SR3-APG power-management technology implements a fast power ramp-up technology. To take advantage of the fast ramp-up feature in SR3-APG, software must first enable it by setting the PRM_PSCON_COUNT[25] HG_RAMPUP bit to 1.

A fail-safe mechanism is put in place to revert back to the standard power ramp-up time by setting the PRM_PSCON_COUNT[25] HG_RAMPUP bit to 0.

The slow ramp-up time can be set through the PRM_PSCON_COUNT[23:16] HG_PONOUT_2_PGDOODIN_TIME bit field when the HG weak chain is used (in other words, the PRM_PSCON_COUNT[25] HG_RAMPUP bit is set to 0x0).

This applies only when SR3-APG is enabled (PRM_PSCON_COUNT[24] HG_EN = 1).

The L1 cache memory state depends on the values of the PRM_PSCON_COUNT[25] HG_RAMPUP and PRM_PSCON_COUNT[24] HG_EN bits. When CPU PD is in CSWRET state and HG_ENABLE and HG_RAMPUP are set to 0x1, L1 cache is in the ON state.

If SR3-APG is disabled (PRM_PSCON_COUNT[24] HG_EN = 0), the L1 cache array can be put in RETENTION during CSWRET regardless of the PRM_PSCON_COUNT[25] HG_RAMPUP bit.

4.3.8 MPU Subsystem AMBA Interface Configuration

There are some inputs at the MPU core (MPU_Cx) boundary which can be tied off to disable certain kind of transactions appearing on the AMBA4 interface:

- SYSBARDISABLE (SBD): This controls whether:
  - Barriers are handled internal to MPU core (SBD = 1), or
  - Barriers are issued on the AMBA4 interface (SBD = 0).
- BROADCASTINNER (BI), BROADCASTOUTER (BO), BROADDCASTMAINTENANCE (BCM): These control whether external snoops are issued on AMBA4 interface or not:
  - BI=BO=BCM=0: No external snoops issued.
  - BI=BO=BCM=1: External snoops can be issued. Not supported in the device.

For detailed description on these inputs, see the ARM *Cortex-A15 Technical Reference Manual* (available at infocenter.arm.com/help/index.jsp).

To give flexibility and mitigate risk, a programmable register (AMBA_IF_MODE) is added to control the tie-off value of these MPU_Cx inputs.

These are the only legal combinations of [BI, BO, BCM, SBD] allowed:

- BI, BO, BCM, SBD = 0001 – Corresponds to **AXI3** mode. Barriers not issued on AMBA4 interface. External snoops not issued. This is the default mode.
- BI, BO, BCM, SBD = 0000 – Corresponds to **ACE non-coherent, no L3** mode. Barriers issued on AMBA4 interface. External snoops not issued.

The ROM code provides specific API for configuring the AMBA_IF_MODE register. For more information, see Section 28.4.3, *Wakeup Generator*, in Chapter 28, *Initialization*.

4.4.10.2 WUGEN_MPU Register Description

Table 4-57. WKG_CONTROL_0

Address Offset	0x0000 0000		
Physical Address	0x4828 1000	**Instance**	WUGEN_MPU
Description	Wake-up generator status register for MPU_C0		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																DOMAINRESET	MPU_WARM_RESET	MPU_COLD_RESET	RESERVED		EVENTO	STANDBYWFE	STANDBYWFI	RESERVED								

Bits	Field Name	Description	Type[1]	Reset
31:16	RESERVED	Reserved	R	0x0000
15	DOMAINRESET	MPU always-on power domain (PD_MPUAON) reset status bit. It shows if the reset occurred previously. 0x0: no reset occur 0x1: reset occur	R	0
14	MPU_WARM_RESET	This bit is set when the MPU_WARM_RESET signal is asserted. 0x0: MPU_WARM_RESET reset signal has not been asserted 0x1: MPU_WARM_RESET reset request has been asserted	RW (WCtoClr)	0
13	MPU_COLD_RESET	This bit is set when the MPU_COLD_RESET signal is asserted. 0x0: MPU_COLD_RESET reset signal has not been asserted 0x1: MPU_COLD_RESET reset request has been asserted	RW (WCtoClr)	0
12:11	RESERVED	Reserved	R	0x0
10	EVENTO	EVENTO status bit. The event output signal is active, when one SEV instruction is executed. This bit is set when a rising edge of EVENTO from CPU is detected. 0x0: Rising edge of EVENTO is not detected 0x1: Rising edge of EVENTO is detected	RW (WCtoClr)	0
9	STANDBYWFE	This bit gives software the visibility to track whether WFE mode have been entered. 0x0: WFE mode has not been entered 0x1: WFE mode has been entered	RW (WCtoClr)	0
8	STANDBYWFI	This bit gives software the visibility to track whether WFI mode have been entered. 0x0: WFI mode has not been entered 0x1: WFI mode has been entered	RW (WCtoClr)	0
7:0	RESERVED	Reserved	R	0x00

(1) RW (WCtoClr) means that a register bit can be read and is cleared by a write of any value.

RESERVED																DOMAINRESET	MPU_WARM_RESET	MPU_COLD_RESET	RESERVED		EVENTO	STANDBYWFE	STANDBYWFI	RESERVED							

Bits	Field Name	Description	Type[1]	Reset
31:16	RESERVED	Reserved	R	0x0000
15	DOMAINRESET	MPU always-on power domain (PD_MPUAON) reset status bit. It shows if the reset occurred previously. 0x0: No reset occurred. 0x1: Reset occurred.	RW (WCtoClr)	0

(1) RW (WCtoClr) means that a register bit can be read and is cleared by a write of any value.

Bits	Field Name	Description	Type[1]	Reset
14	MPU_WARM_RESET	This bit is set when the MPU_WARM_RESET signal is asserted. 0x0: MPU_WARM_RESET reset signal has not been asserted. 0x1: MPU_WARM_RESET reset request has been asserted.	RW (WCtoClr)	0
13	MPU_COLD_RESET	This bit is set when the MPU_COLD_RESET signal is asserted. 0x0: MPU_COLD_RESET reset signal has not been asserted. 0x1: MPU_COLD_RESET reset request has been asserted.	RW (WCtoClr)	0
12:11	RESERVED	Reserved	R	0x0
10	EVENTO	EVENTO status bit. The event output signal is active, when one SEV instruction is executed. This bit is set when a rising edge of EVENTO from CPU is detected. 0x0: Rising edge of EVENTO is not detected. 0x1: Rising edge of EVENTO is detected.	RW (WCtoClr)	0
9	STANDBYWFE	This bit gives software the visibility to track whether WFE mode have been entered. 0x0: WFE mode has not been entered. 0x1: WFE mode has been entered.	RW (WCtoClr)	0
8	STANDBYWFI	This bit gives software the visibility to track whether WFI mode have been entered. 0x0: WFI mode has not been entered. 0x1: WFI mode has been entered.	RW (WCtoClr)	0
7:0	RESERVED	Reserved	R	0x00

Table 4-81. AUX_CORE_BOOT_0

Address Offset	0x800		
Physical Address	0x4828 1800	**Instance**	WUGEN_MPU
Description	This register is used by the ROM code and OS during SMP boot. It is intended to store the execution start address of MPU_C1. When needed, the SMP OS (executing on the MPU_C0) wakes up MPU_C1 by executing a SEV command. MPU_C0 needs to communicate some start-up information (for example, the starting address) to MPU_C1.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 4-83. AUX_CORE_BOOT_1

Address Offset	0x804		
Physical Address	0x4828 1804	**Instance**	WUGEN_MPU
Description	This register is used by the ROM code and OS during SMP boot. It is used to indicate boot status to either MPU core. When MPU_C1 receives an event (caused by the SEV command), it continues execution in the ROM, which set up the code to branch to the address signaled by MPU_C0.

Dual Cortex-A15 MPU Subsystem Register Manual • WD_TIMER_MPU Register Summary: [5] • WD_TIMER_MPU Register Description: [6]

Table 4-96. WDT_COUNT_REGISTER_i

Address Offset	0x0000 0004 + (0x20 * i)	**Index**	i = 0 to 1
Physical Address	0x482A 0004 + (0x20 * i)	**Instance**	WD_TIMER_MPU
Description	This register is a 32-bit decrementing counter. The decrement rate is programmed in the WDT_PRESCALER_REGISTER_i. The WDT_COUNT_REGISTER_i can be read to get the current count. It decrements if the WD_TIMER_MPU_Cx is enabled (WDT_CONTROL_REGISTER_i[0] ENABLE = 0x1). If the processor corresponding to the watchdog channel is in debug state, the counter does not decrement until the processor returns to non-debug state. The WDT_COUNT_REGISTER_i decrements down to zero and stops. The only way to update the WDT_COUNT_REGISTER_i is to write to the WDT_LOAD_REGISTER_i. If a software failure prevents the WDT_COUNT_REGISTER_i from being refreshed, the WDT_COUNT_REGISTER_i reaches zero, the watchdog timeout status flag is set and all interrupt requests or reset requests enabled in the WDT_CONTROL_REGISTER_i are signalled. If a reset request is enabled, the global PRCM is then responsible for resetting the MPUSS. Debug state is inferred by monitoring the DBGACK signal corresponding to this core. This register is reset by warm reset of the corresponding MPU core.		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CURRENTCOUNT																															

Bits	Field Name	Description	Type	Reset
31:0	CURRENTCOUNT	Current count of the WD_TIMER_MPU.	R	0x0000 0000

Table 4-98. WDT_WARNING_REGISTER_i

Address Offset	0x0000 0008 + (0x20 * i)	**Index**	i = 0 to 1
Physical Address	0x482A 0008 + (0x20 * i)	**Instance**	WD_TIMER_MPU
Description	The WDT_COUNT_REGISTER_i is compared to the WDT_WARNING_REGISTER_i. If WDT_COUNT_REGISTER_i is less than or equal to the WDT_WARNING_REGISTER_i and WDT_CONTROL_REGISTER_i[8] WARNEN = 0b1, a warning interrupt is signalled to the INTC_MPU. The warning condition can be used to signal an interrupt that gives software a notice that the WD_TIMER_MPU_Cx is getting close to a timeout, when a more serious action should be taken.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WARNING_WATERMARK																															

Bits	Field Name	Description	Type	Reset
31:0	WARNING_WATERMARK	A warning condition occurs when the WDT_COUNT_REGISTER_i value is less than or equal to the WDT_WARNING_REGISTER_i.	RW	0x0000 0000

4.4.13.2 MA_MPU_LSM Register Description

For the description of the MA_MPU_LSM registers, see Section 15.2.6, *DMM Register Manual*, in Chapter 15, *Memory Subsystem*, where MA_LISA_LOCK corresponds to the DMM_LISA_LOCK register description, and MA_LISA_MAP_i corresponds to the DMM_LISA_MAP_i register description.

4.4.14 MA_MPU_WP Registers

For information about the MA_MPU_WP registers and their description, see Chapter 29, *On-Chip Debug Support*.

DSP Subsystem

This chapter describes the digital signal processor (DSP) subsystem of the device.

Topic **Page**

5.1 DSP Subsystem Overview

The device includes the digital signal processor (DSP) subsystem, based on a derivative of the TMS320DMC64x+™ very long instruction word (VLIW) DSP core.

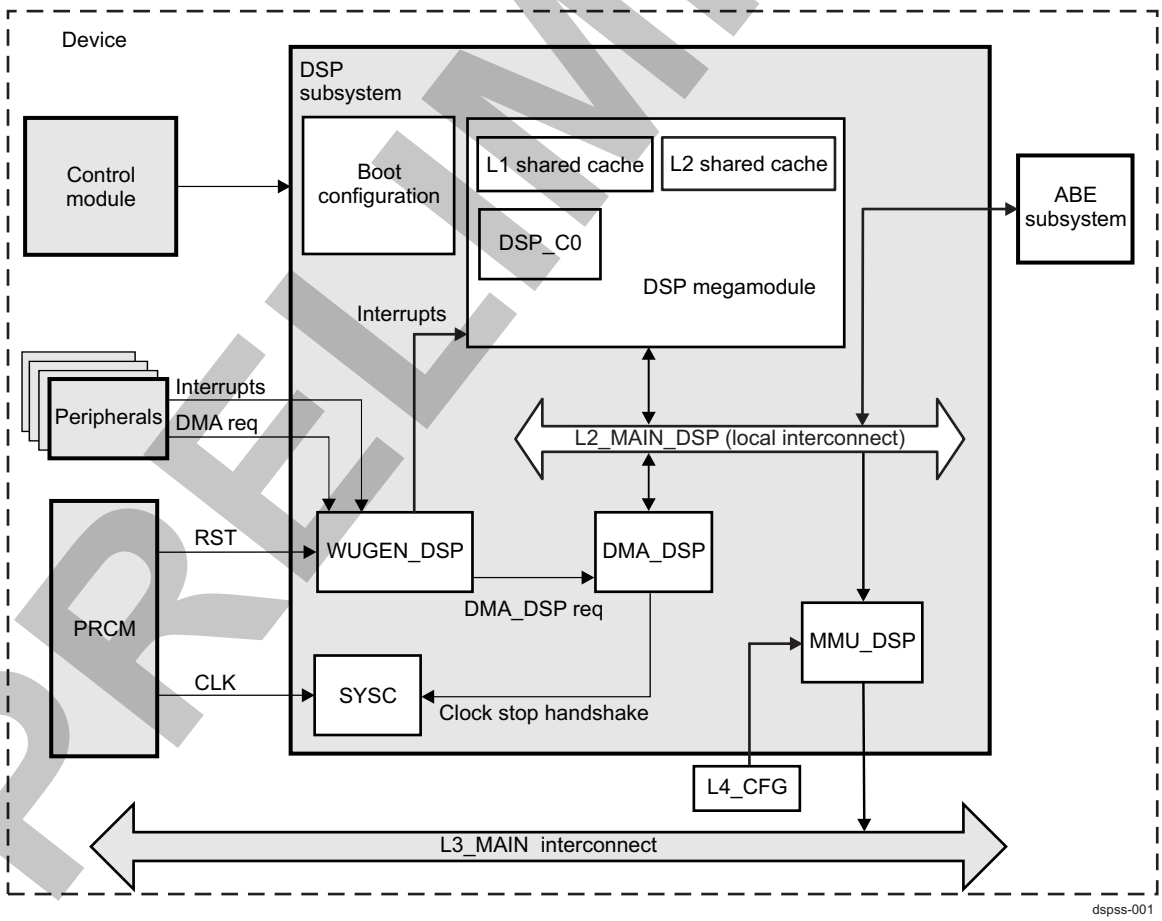
The internal architecture is an assembly of the following components:

- High-performance TI DSP (TMS320DMC64x™) derivative (DSP_C0) integrated in a megamodule, including local level 1 (L1) and level 2 (L2) cache and memory controllers for audio processing and general-purpose imaging and video processing
- L1 and L2 shared cache - (part of the DSP megamodule located - SCACHE_MMU_DSP block)
- Subsystem counter timer module (SCTM)
- Dedicated enhanced data memory access engine - DMA_DSP, to download/upload data from/to memories and peripherals external to the subchip
- Dedicated memory management unit (MMU_DSP) for accessing level 3 (L3_MAIN) interconnect address space
- Local interconnect network
- Dedicated SYSC and wake-up generator (WUGEN_DSP) modules responsible for power management, clock generation, and connection to the power, reset, and clock management (PRCM) module

For information about C64x™ to C64x+™ core migration, see the documents listed in Section 5.3.2.7, *Other DSP Reference Documents*.

Figure 5-1 is the DSP subsystem top-level architecture.

Figure 5-1. DSP Subsystem Highlight



5.1.1 DSP Subsystem Key Features

The main features of the DSP subsystem are:

- 32-bit fixed-point media processor
- VLIW architecture based on programmable enhanced version of the C64x DSP core
- Coprocessor connection through the coprocessor hardware Interface
- Four instructions per cycle, four execution units:
  - Optimized instruction set for video and image processing
  - Four 8 x 8 or 16 x 16 multiply accumulate (MAC) per cycle
  - Four slave synchronous die (SAD) per cycle
  - Eight interpolations (a + b + 1) >> 1 per cycle
  - Two (32-bit x 32-bit -> 64-bit) multiply operations per cycle
- Low-power processor and megamodule:
  - Dynamically mixed 32-bit and 16-bit instruction sets
  - Separate power domain
  - Supported multiple power-down states
- 2-level memory subsystem hierarchy:
  - L1 (program and data):
    - 32-KiB 4-way set associative cache-32-byte cache line
  - L2 (program and data):
    - 128-KiB 8-way set associative cache-32-byte cache line
- Private direct memory access controller - DMA_DSP:
  - 128 logical channels
  - 1-dimensional/2-dimensional (1D/2D) addressing
  - Chaining capability
  - Fully pipelined, two 64-bit read ports, two 64-bit write ports
  - Single-access 32- or 64-byte incrementing bursts
- L1 interrupt controller (INTC_DSP)
- Local DSP digital phase-locked loop (DPLL_IVA) supplying DSP subsystem clocking
- 32-entry MMU (MMU_DSP) for seamless integration in high-level operating system (OS) environment
- DSP subsystem interfaces:
  - 64-bit L3_MAIN port shared for external memory accesses:
    - Multithreaded link shared by the DSP core - DSP_C0 and DMA_DSPs
    - Interface with the L3_MAIN interconnect that can be synchronous or asynchronous for clock decoupling between DSP and L3_MAIN
    - Incrementing burst support
    - Critical line first, to reduce line-fetch latency to the processor
  - Host port interface (HPI) for MMU programming and access to DSP internal memories. Can be synchronous or asynchronous.
  - System interfaces: Clocking, power management
- C-friendly environment (state-of-the-art C-compiler for VLIW architecture)
- TI low-overhead DSP-BIOS™ OS
- Backward compatibility (not binary compatible) with existing C64x video coders.decoders (codecs) and high level of programmability and flexibility

Known restrictions on the C64x+ DSP core:

- 4-issue VLIW central processing unit (CPU) instead of 8-issue
- SPLOOP not supported

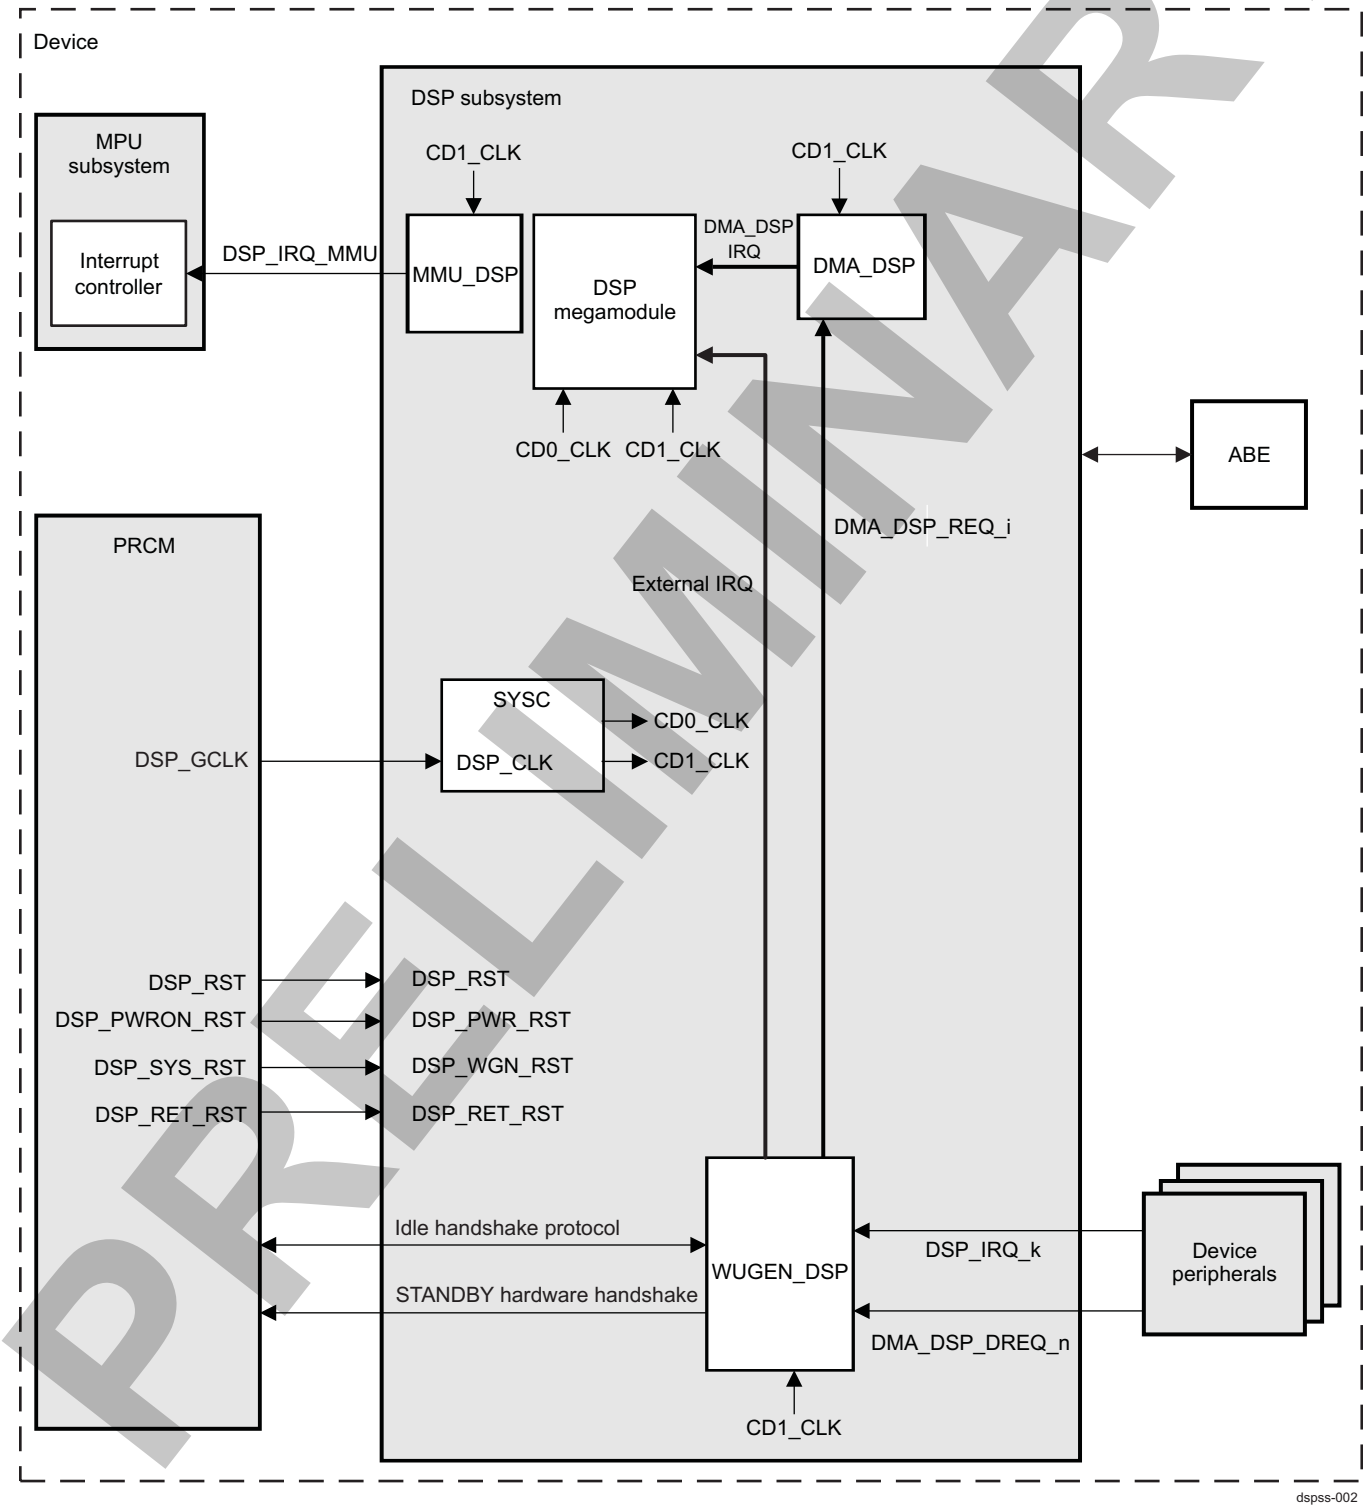
- L1 and L2 flat static random access memory (SRAM) not supported
- No EFI port

5.2 DSP Subsystem Integration

This section describes the integration of the module in the device, including information about clocks, resets, and hardware requests.

Figure 5-2 shows the integration of the DSP subsystem.

Figure 5-2. DSP Subsystem Integration



NOTE: For more information about the IDLE hardware handshake and the wake-up request, see Section 3.1.1.1.2, *Module-Level Clock Management*, in Chapter 3, *Power, Reset, and Clock Management*.

Table 5-1 through Table 5-3 summarize the integration of the module in the device.

Table 5-1. Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
DSP	PD_DSP	L3_MAIN

Table 5-2. Clocks and Resets

Clocks				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
DSP	DSP_CLK	DSP_GCLK	PRCM module	For information about PRCM clock gating and management, see Section 3.7.2, *PD_DSP Description* in Chapter 3, *Power, Reset, and Clock Management*.
Resets				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
DSP	DSP_PWR_RST	DSP_PWRON_RST	PRCM module	For information about PRCM reset sources and distribution, see Section 3.7.2, *PD_DSP Description* in Chapter 3, *Power, Reset, and Clock Management*.
	DSP_RET_RST	DSP_RET_RST	PRCM module	
	DSP_WGN_RST	DSP_SYS_RST	PRCM module	
	DSP_RST	DSP_RST	PRCM module	

Hardware requests include interrupt requests and DMA requests. The INTC_DSP receives interrupts from the DSP subsystem (internal) and from other modules (D_IRQ_k interrupt signals). For more information about interrupt requests, see Table 5-6.

Table 5-3 lists the DMA requests.

Table 5-3. Hardware Requests – DMA Requests

Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
DSP	Reserved	DMA_DSP_DREQ_0-1	DMA_DSP	Reserved
	MCBSP1_DREQ_TX	DMA_DSP_DREQ_2	DMA_DSP	MCBSP1 transmit request [0]
	MCBSP1_DREQ_RX	DMA_DSP_DREQ_3	DMA_DSP	MCBSP1 receive request [0]
	MCBSP2_DREQ_TX	DMA_DSP_DREQ_4	DMA_DSP	MCBSP2 transmit request [0]
	MCBSP2_DREQ_RX	DMA_DSP_DREQ_5	DMA_DSP	MCBSP2 receive request [0]
	MCBSP3_DREQ_TX	DMA_DSP_DREQ_6	DMA_DSP	MCBSP3 transmit request [0]
	MCBSP3_DREQ_RX	DMA_DSP_DREQ_7	DMA_DSP	MCBSP3 receive request [0]
	Reserved	DMA_DSP_DREQ_8-9	DMA_DSP	Reserved
	UART3_DREQ_TX	DMA_DSP_DREQ_10	DMA_DSP	UART3 transmit request [0]
	UART3_DREQ_RX	DMA_DSP_DREQ_11	DMA_DSP	UART3 receive request [0]
	Reserved	DMA_DSP_DREQ_12-27	DMA_DSP	Reserved
	ABE_DREQ_FIFO0	DMA_DSP_DREQ_28	DMA_DSP	Audio back-end (ABE) - request FIFO 0
	ABE_DREQ_FIFO1	DMA_DSP_DREQ_29	DMA_DSP	ABE - request FIFO 1

Table 5-3. Hardware Requests – DMA Requests (continued)

Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
	ABE_DREQ_FIFO2	DMA_DSP_DREQ_30	DMA_DSP	ABE - request FIFO 2
	ABE_DREQ_FIFO3	DMA_DSP_DREQ_31	DMA_DSP	ABE - request FIFO 3
	ABE_DREQ_FIFO4	DMA_DSP_DREQ_32	DMA_DSP	ABE - request FIFO 4
	ABE_DREQ_FIFO5	DMA_DSP_DREQ_33	DMA_DSP	ABE - request FIFO 5
	ABE_DREQ_FIFO6	DMA_DSP_DREQ_34	DMA_DSP	ABE - request FIFO 6
	ABE_DREQ_FIFO7	DMA_DSP_DREQ_35	DMA_DSP	ABE - request FIFO 7
	MCASP_DREQ_AXEVT	DMA_DSP_DREQ_36	DMA_DSP	MCASP transmit request
	Reserved	DMA_DSP_DREQ_37-41	DMA_DSP	Reserved
	MCPDM_DREQ_UP_LINK	DMA_DSP_DREQ_42	DMA_DSP	MCPDM Uplink DMA request
	MCPDM_DREQ_DN_LINK	DMA_DSP_DREQ_43	DMA_DSP	MCPDM Downlink DMA request
	DMIC_DREQ	DMA_DSP_DREQ_44	DMA_DSP	DMIC DMA Request
	Reserved	DMA_DSP_DREQ_45-63	DMA_DSP	Reserved

NOTE:

- For a description of the interrupt source, see Section 5.3.7, *Interrupt Requests*.
- For a description of the DMA source, see Section 5.3.8, *DMA Requests*.

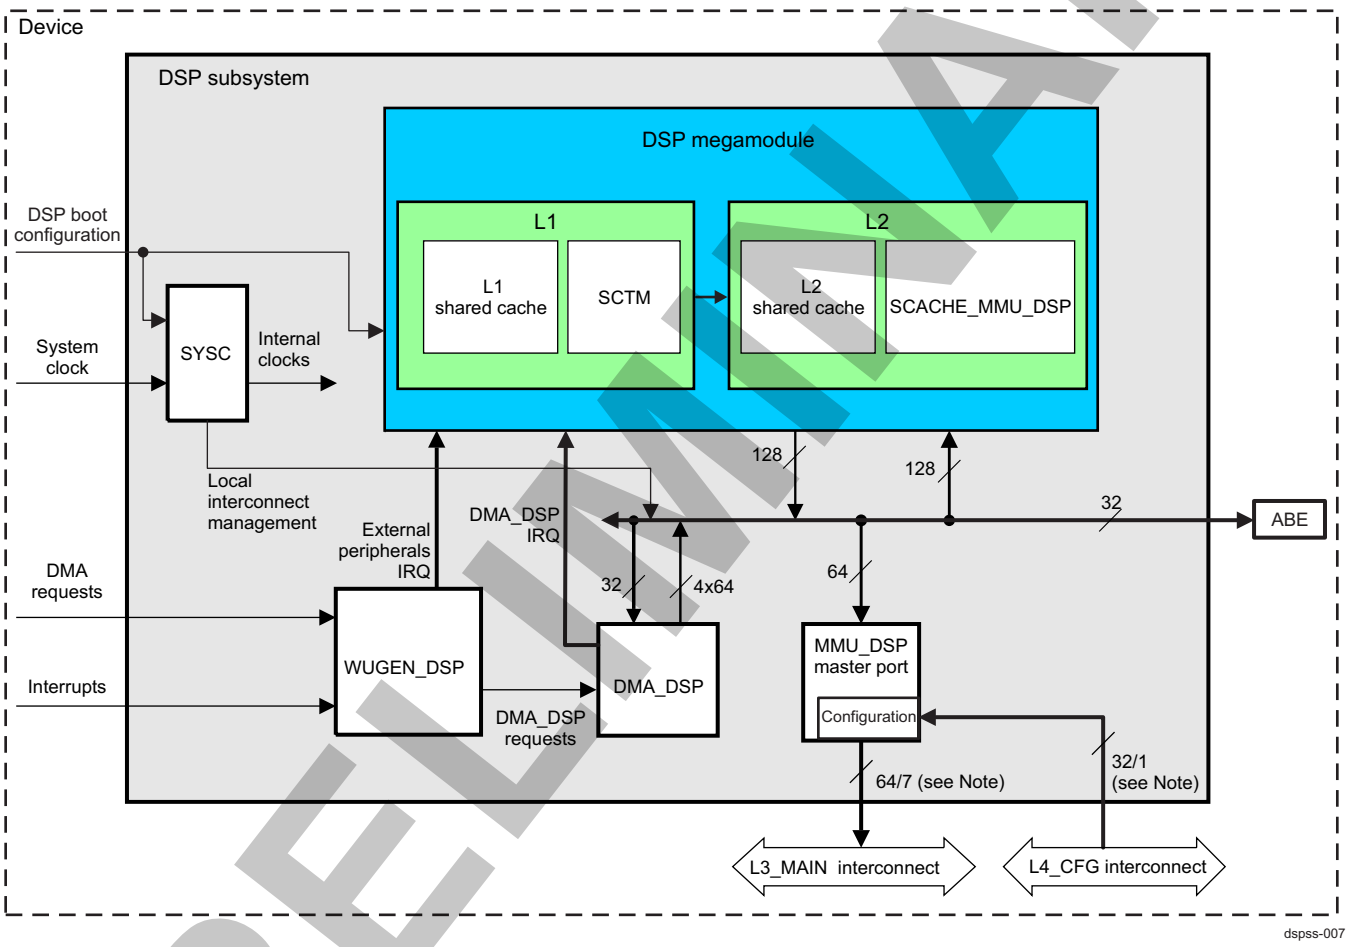
5.3 DSP Subsystem Functional Description

5.3.1 Block Diagram

The DSP subsystem is composed of a DSP megamodule coupled with several submodules that enable its integration in the device architecture. The DSP subsystem provides one slave port connected to the L4_CFG interconnect (used to configure MMU_DSP from the device MPU) and one master port which is connected to the L3_MAIN interconnect. There is also a single master port for direct access to a port of the ABE subsystem.

Figure 5-3 is a block diagram of the DSP subsystem.

Figure 5-3. DSP Subsystem Block Diagram



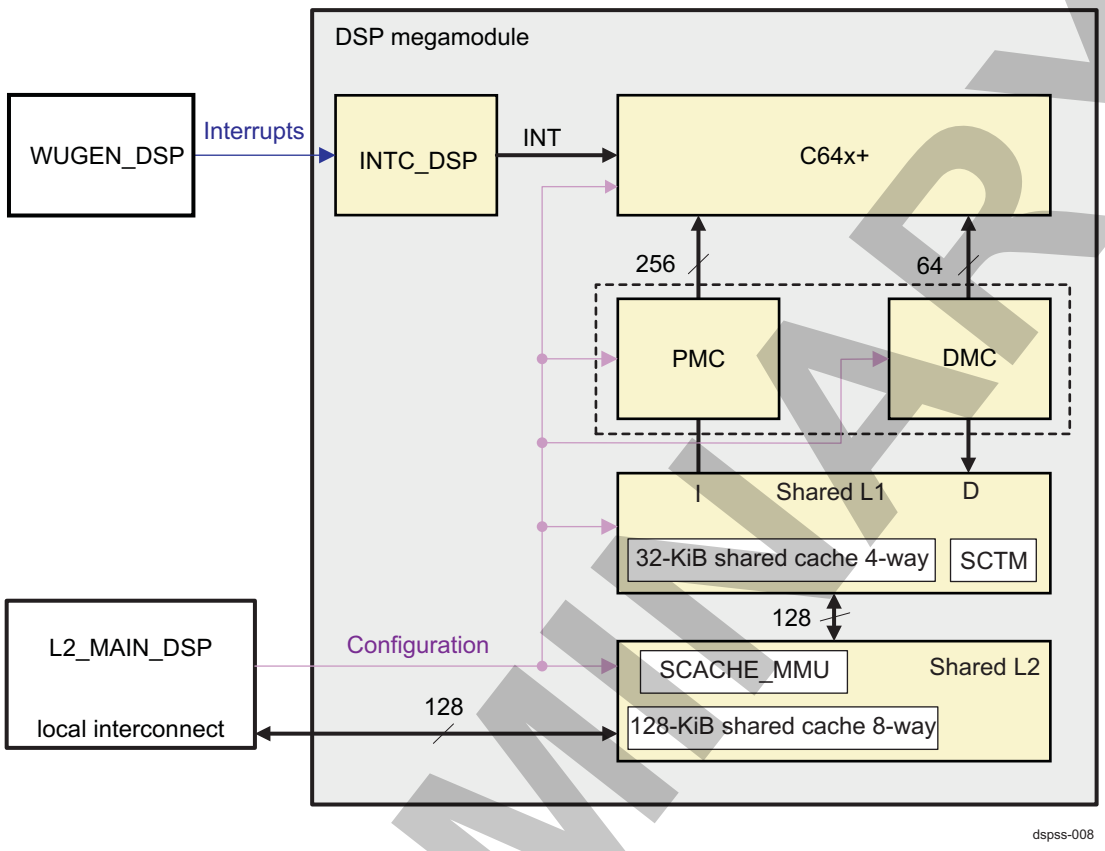
NOTE: The first number indicates bus width in bits, and the next indicates the number of L3_MAIN connected targets/ initiators for DSPSS master / slave ports. For more information, see subchapter Section 14.2, *L3 Interconnect* in Chapter 14, *Interconnect*.

5.3.2 DSP Megamodule

The C64x+ DSP megamodule is a class of derivative sections of the generalized embedded megamodule. The DSP megamodule is hardware-configurable and comprises a version of the C64x+, an L1 program memory controller (PMC), an L1 data memory controller (DMC), and L1/L2 shared caches.

Figure 5-4 is a block diagram of the DSP megamodule.

Figure 5-4. DSP Megamodule Block Diagram



5.3.2.1 DSP Overview

The C64x+ is an extension of the first C64x DSP section.

The DSP core features:

- 32-bit fixed-point media processor
- VLIW architecture
- Four instructions per cycle, four execution units
  - Optimized instruction set for video and image processing
  - Four 8 x 8 or 16 x 16 MACs per cycle
  - Four SADs per cycle
  - Eight interpolations (a + b + 1) >> 1 per cycle
  - Two (32-bit x 32-bit > 64-bit) multiply operations per cycle

In addition to the existing C64x features, the C64x+ includes the following:

- Compact instructions
- Extended function support
- Exception handling
- Privilege mode support
- HLOS time-stamp counter register

Known restrictions on the C64x+ DSP core are:

- 4-issue VLIW CPU instead of 8-issue
- SPLOOP not supported

- L1 and L2 flat SRAM not supported
- No EFI port

For information about the C64x+ DSP, see the C64x+ reference manual listed in Section 5.3.2.7, *Other DSP Reference Documents*.

5.3.2.2 PMC Overview

The PMC is the DSP megamodule component that delivers program fetch packets when they are requested by the DSP_C0.

The PMC supports the following features:

- One 256-bit fetch packet per cycle (sustainable)
- DMA transfer from/to L1/L2 caches
- Fair priority-based arbitration between DSP, DMA_DSP, and cache controller for access to the SRAM
- Block and global program-initiated cache coherence support (invalidate)
- Freeze mode

For more information, see Section 5.4.5, *Memory Management*.

5.3.2.3 DMC Overview

The DMC is the DSP megamodule component that reads or writes data from/to local memories, as requested by the DSP.

The DMC supports the following features:

- One 64-bit memory access per cycle (sustainable)
- A memory access pair can be any combination of read and write, with no incurred penalty.
- DMA transfer from/to L1/L2 caches
- Fair priority-based arbitration between the DSP, DMA_DSP, and cache controller for access to the SRAM
- Hardware coherence maintenance with L2 (snooping)
- Block and global program-initiated cache coherence support (write-back, invalidate, and write-back-invalidate)
- Freeze and bypass mode

5.3.2.4 Shared L1/L2 Cache Overview

The following features are supported by the shared cache design:

- 32-KiB L1 shared cache implemented with high-performance bit cell to run at full speed
- 128-KiB L2 shared cache implemented with high-density bit cell to optimize area at half speed
- L1 cache is 32B line size, 4-way set-associative and organized as 16-bank.
- L2 cache is 32B line size and 8-way set associative.
- L1 cache supports snooping.
- L2 cache slave port to support snooping from DMA_DSP accesses
- Fully pipelined/supports critical-word-first
- Write-combining
- Fill and eviction buffers, and hit in fill buffer
- Dynamic sizing, I/D allocation
- Prefetch 4 lines/preload N lines
- Background preload/clean

5.3.2.5 Attribute MMU Overview

The attribute MMU for the shared cache - SCACHE_MMU_DSP, provides the multi-access cache with a region-based address translation, read/write control, access type control, endiannism, and multilevel cache maintenance.

The SCACHE_MMU_DSP is directly connected to the shared cache, and there is a dedicated interface for pipeline write policy management. L1 policies are queried at the allocation control of the cache, and L2 policies are propagated to the master interface.

For flexibility, the SCACHE_MMU_DSP can be dedicated to an L1 or an L2 cache configuration, with or without address translation, or as an L1/L2 cache combination.

The SCACHE_MMU_DSP supports different page sizes: large, medium, and small. The number of large pages, number of medium pages, etc., is defined at design time. The maximum number of large pages is eight. This address space includes addresses for all eight regions. However, if the DSP subsystem defines only five large pages, only the first five addresses are valid.

The page sizes for the 17 entries are:

- Large pages (eight): The page size supported is 512 MiB.
- Medium pages (seven): The page sizes supported are 128 KiB and 1 MiB.
- Small pages (two): The page sizes supported are 4 KiB and 32 KiB.

The size of the page is configured by setting:

- SCACHE_MMU_LARGE_POLICY_i[1] SIZE
- SCACHE_MMU_MED_POLICY_j[1] SIZE
- SCACHE_MMU_SMALL_POLICY_k[1] SIZE

The logical source address is configured in:

- SCACHE_MMU_LARGE_ADDR_i[31:25] ADDRESS
- SCACHE_MMU_MED_ADDR_j[31:17] ADDRESS
- SCACHE_MMU_SMALL_ADDR_k[31:12] ADDRESS

The logical source translated address is configured in:

- SCACHE_MMU_LARGE_XLTE_i[31:25] ADDRESS
- SCACHE_MMU_MED_XLTE_j[31:17] ADDRESS
- SCACHE_MMU_SMALL_XLTE_k[31:12] ADDRESS

When the SIZE bit is set to 0, all the bits in the ADDRESS bit field of the corresponding logical source address and logical source translated address can be used.

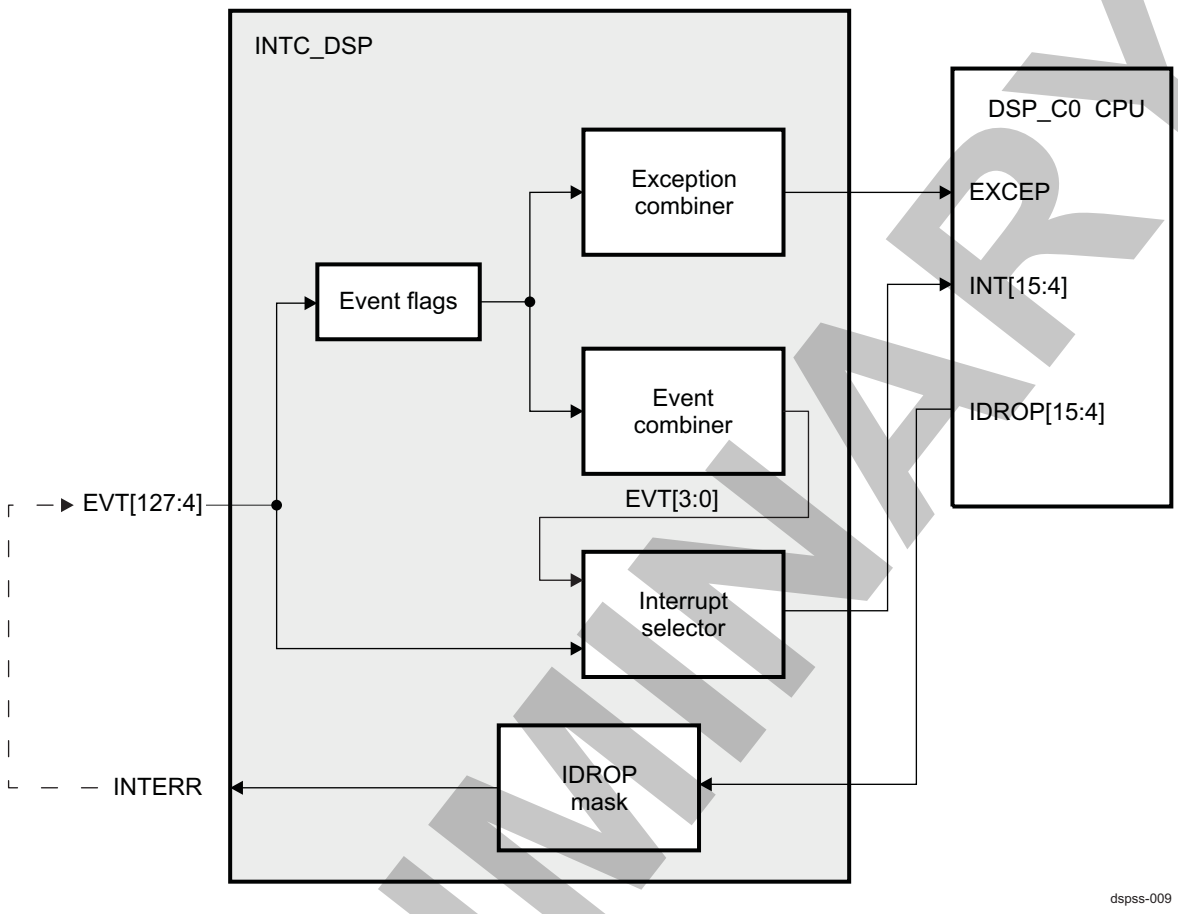
When the SIZE bit is set to 1, the ADDRESS bit field of the corresponding logical source address and logical source translated address must be programmed only with addresses that can address the size of a second possible page.

5.3.2.6 DSP INTC

The DSP megamodule interrupt controller - INTC_DSP detects, potentially combines, and routes up to 128 system events (internal and external) to the DSP_C0 CPU interrupt lines. Table 5-6 lists the global interrupt mappings of the DSP subsystem (internal and external interrupts).

The DSP_C0 CPU has 12 maskable interrupts and one exception input. The INTC_DSP includes an interrupt selector, exception combiner, and event combiner. The interrupt selector allows the routing of any of the 128 system events (or a combination of them) to the 12 maskable interrupts of the DSP_C0 CPU, and software determines the priorities of those system events. To handle potential conflicts, the 12 CPU interrupts have fixed priorities. The exception combiner allows the combination of any of the 128 system events to the single exception input of the DSP_C0 CPU (see Figure 5-5).

Figure 5-5. DSP Megamodule INTC Block Diagram



NOTE: Not all 128 event inputs of the INTC_DSP are connected to an internal or external event line. Table 5-6 lists the global interrupt mapping of the INTC_DSP. Some interrupts at the DSP boundary are reserved for future use or are not used by the DSP subsystem. For information about the DSP core interrupt controller - INTC_DSP, see the C64x+ DSP documents listed in Section 5.3.2.7, *Other DSP Reference Documents*.

5.3.2.6.1 Event Type

The INTC_DSP provides three types of interrupt sources to the DSP_C0 CPU:

- Single event
  - A single system event can be directly routed to a CPU interrupt input.
  - A dropped system event is supported through the CPU dropped interrupt reporting mechanism (if the CPU misses the interrupt input, the system event is missed).
- Combined event
  - Up to four event combiners
  - Each combiner allows up to 32 system events to be logically ORed into a single event that can be routed to the DSP_C0 CPU.
- Exception event: This event is considered a single event, but it is directly connected to the exception input of the DSP_C0 CPU.

5.3.2.6.2 Event Behavior

- Single event source: The interrupt selector routes 1 of 124 events to a DSP_C0 CPU interrupt, as

programmed in the interrupt selector registers (SYS_INTC_INTMUXj, where j = 1 to 3). Logic in the CPU and INTC_DSP combine to detect instances in which an interrupt request is asserted before an earlier interrupt request is serviced. The INTC_DSP records the interrupt number of the first interrupt and keeps this information until directed to release the interrupt, either through reset or by application software. This record can be used as an additional system event to notify the application of an interrupt failure. Interrupts that qualify for dropped detection are defined through an IDROP mask that sets the SYS_INTC_INTDMASK register. The masked IDROP event output (EVT96; see Table 5-6) is available as a system event that can be selected as a DSP_C0 CPU interrupt or an exception event.

- Combined source: The event combiners create a combined event from the logical OR of 32 system-event flags qualified by a mask provided through programmable registers (SYS_INTC_EVTMASKi, where i = 0 to 3). The combination of the event flags creates an event that is asserted when any of the event flags included in its generation is active. Software must clear the event flags (SYS_INTC_EVTCLRi, where i = 0 to 3) to deassert a combined event.

  NOTE: The use of event flags makes it impossible for the CPU to detect the dropping of independent system events; therefore, dropped interrupt capability is not directly supported for combined events.

  The interrupt event combiners create four shared interrupt sources:

  – EVT0: Logical OR of SYS_INTC_EVTFLAGi[31:4] (where i = 0) masked by SYS_INTC_EVTMASKi[31:4] (i = 0)
  – EVT1: Logical OR of SYS_INTC_EVTFLAGi[63:32] (where i = 1) masked by SYS_INTC_EVTMASKi[63:32] (i = 1)
  – EVT2: Logical OR of SYS_INTC_EVTFLAGi[95:64] (where i = 2) masked by SYS_INTC_EVTMASKi[95:64] (i = 2)
  – EVT3: Logical OR of SYS_INTC_EVTFLAGi[127:96] (where i = 3) masked by SYS_INTC_EVTMASKi[127:96] (where i = 3)

  SYS_INTC_EVTFLAGi are the event flag registers and SYS_INTC_EVTMASKi are the event mask registers. These combined events are presented to the interrupt selection logic.

- Exception event source: As with the event combiner, the exception combiner allows multiple system events to be grouped as a single event input to the CPU, and the combiner provides mask registers to remove undesirable events. Because only one exception is input to the CPU, all mask registers work together to combine up to 128 events as a single EXCEP output. This lets the CPU service all available system exceptions.

  The shared exception source is created as follows:

  EXCEP: Logical OR of EF[127:4] masked by XM[127:4]

  Where EF[i × 32 + j] = EVTFLAGi[j] and XM[i × 32 + j] = EXPMASKi[j] (i = 0, 1, 2, 3 and j = 0 to 31).

  The logic is similar to that of the event combiners, except that only one combined event is routed to EXCEP.

5.3.2.6.3 Event Detection

The INTC_DSP contains a set of status and control registers to manage the status of system events received by the controller. These include set, flag, and clear registers that cover all 128 system events. Enabling of the events is managed in the CPU for direct mapped interrupts, in the event combiner for combined events, and in the exception combiner for system exceptions. Events to the INTC_DSP can be enabled or disabled only at the event source.

The event flag registers (SYS_INTC_EVTFLAGi, where i = 0 to 3) capture every system event received, regardless of its destination: event combiner, exception combiner, or interrupt selector. Events that are not masked by the event combiner or the exception combiner are captured in the SYS_INTC_EVTFLAGi register (where i = 0 to 3) corresponding to the event and are used to determine when the combined event is generated. Events that are masked by the event combiner or the exception combiner are captured in the SYS_INTC_EVTFLAGi register but do not affect when the DSP_C0 CPU interrupt is generated.

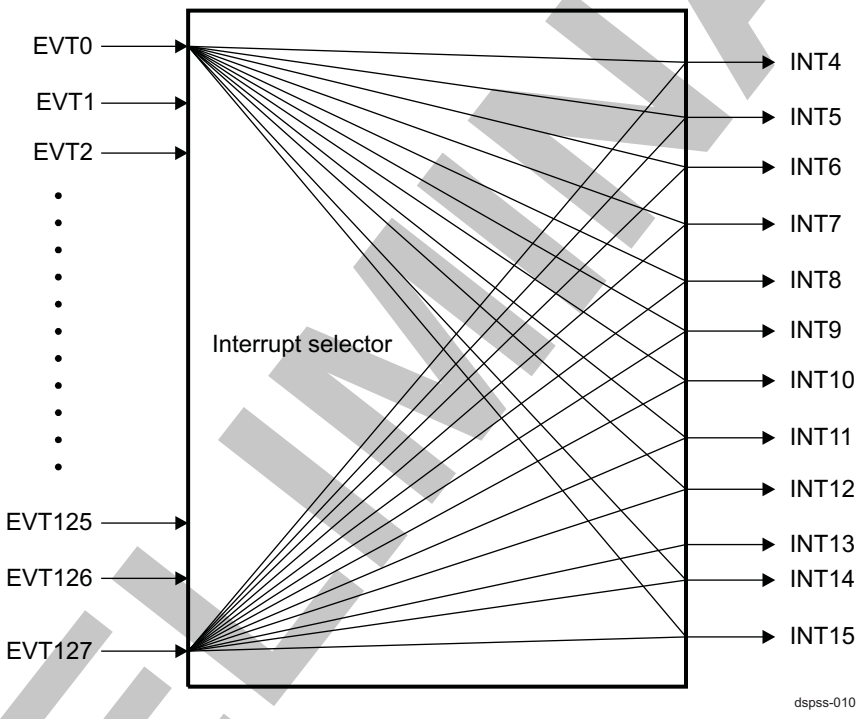
The event flags in the SYS_INTC_EVTFLAGi registers retain the value of 1 for any event received. These registers are read-only and must be cleared through the write-only SYS_INTC_EVTCLRi registers. The SYS_INTC_EVTSETi registers can be used to manually set bits in the SYS_INTC_EVTFLAGi registers, including those that are masked.

NOTE: Because external events are maintained by the peripheral until they are explicitly cleared by software, drop event detection does not work for external events (interrupts from peripherals external to the DSP subsystem).

5.3.2.6.4 Event Selection

The DSP_C0 CPU has 12 available maskable interrupts. The interrupt selector allows any of the 128 system events, either from the event inputs or from the event combiners, to be routed to any of the 12 CPU interrupt inputs (see Figure 5-6).

Figure 5-6. Interrupt Selector Block Diagram



Users can choose which of the 128 input events is mapped to each of the 12 CPU interrupts by writing the event number in the bit field corresponding to the CPU interrupt in the SYS_INTC_INTMUXj register. CPU priority is fixed. This event -> interrupt mapping allows software to define the priority of the event. For more information, see Section 5.4, *DSP Subsystem Basic Programming Guide*.

5.3.2.6.5 Event Combination

The event combiner allows multiple system events to be combined into a single event for routing to the interrupt selector. This allows the CPU to service all available system events, even though only 12 are available.

A set of event mask registers (SYS_INTC_EVTMASKi, where i = 0 to 3) is used to program the event combiner. These registers allow up to 32 events to be combined into a single event output that is used as one DSP_C0 CPU interrupt. The event mask bits in the SYS_INTC_EVTMASKi registers act as enablers for the received system events combined on the event outputs. There are four event outputs to the interrupt selector (EVT[3:0]).

By default, every system event is unmasked and combined with its associated EVTx. To mask out an event source (for example, to disable an event from being combined), the corresponding mask bit (the SYS_INTC_EVTMASKi[y] EMy bit for EVTy) must be set to 1.

NOTE: Because the event masks for events 0 through 3 are combined events, and thus cannot contribute to the generation of a combined event, they are reserved.

For more information, see Section 5.4.4, *Interrupt Management*.

5.3.2.6.6 Interrupt Event Error

The INTC_DSP can generate a system event internally routed to system event input EVT96. This event is generated when a DSP_C0 CPU interrupt is received while the interrupt flag (IFR, internal DSP register) is already set in the CPU. This signals possible problems in the code, such as whether interrupts were disabled for an extended time or pipelined (noninterruptible) code sections were too long.

NOTE: The same strategy of register settings (events, event set, event clear, event mask) is used in the WUGEN_DSP (which is not an interrupt controller), which enables defining wake-up events so they can wake up the DSP subsystem. For more information, see Section 5.3.9, *Wake-Up Generator*.

For more information on interrupt management, see Section 5.4.4, *Interrupt Management*. For information on associated programming, see Section 5.4, *DSP Subsystem Programming Guide*.

5.3.2.7 Other DSP Reference Documents

For more information about the DSP megamodule architecture, instruction set, and DSP core INTC, and for a complete description of the DSP memory-mapped registers, see the following documents (www.ti.com):

- *TMS320C6000 DSP Peripherals Overview Reference Guide* (TI Literature number SPRU190) describes the peripherals available on the TMS320C6000 DSPs.
- *TMS320C64x™ Technical Overview* (TI Literature number SPRU395) introduces the TMS320C64x DSP and discusses the application areas enhanced by the TMS320C64x VelociT.
- *TMS320C64x+ DSP Megamodule Reference Guide* (TI Literature number SPRU871) describes the C64x+ megamodule peripherals.
- *TMS320C64x/C64x+ DSP CPU and Instruction Set Reference Guide* (TI Literature number SPRU732)
- *TMS320C6000 Programmer's Guide* (TI Literature number SPRU198) describes ways to optimize C and assembly code for the TMS320C6000 DSPs, and includes application program examples.

5.3.3 DSP DMA

The DSP subsystem has an integrated DMA module - DMA_DSP to transfer instructions and data from/to external memory connected to the L3_MAIN interconnect to/from L1 and L2 local memories in the DSP megamodule. The DMA_DSP can also perform transfers between external memories and between DSP megamodule internal memories, with some performance loss caused by resource sharing between the read and write ports. For transfers between DSP megamodule internal memories, use the DMA_DSP with the locked feature.

The DMA_DSP is based on two primary components:

- DMA third-party channel controller (TPCC)
- DMA third-party transfer controller (TPTC)

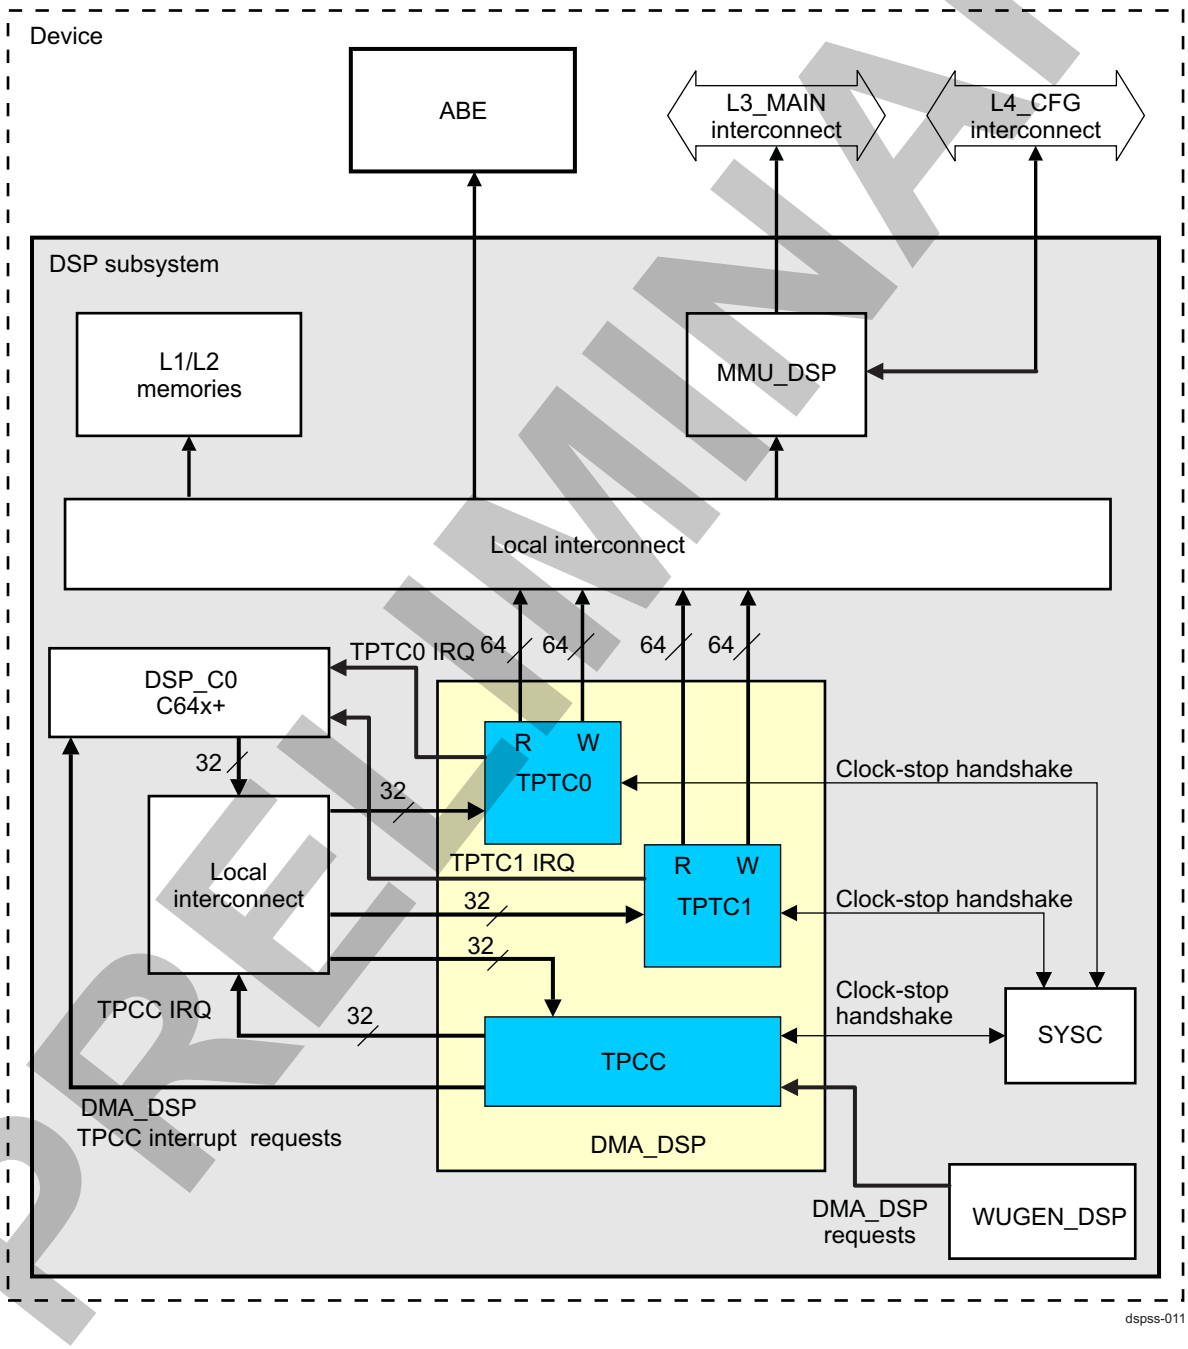
There are two instances of the TPTC in the DSP subsystem.

Figure 5-7 shows how the DMA_DSP is integrated in the DSP subsystem:

- Code running on the DSP can configure the DMA_DSP; through the configuration port of the DSP megamodule and the local level2 interconnect - L2_MAIN_DSP, the code can program DMA transfers and trigger them by software by writing to the TPCC configuration registers.

- Preprogrammed DMA transfers can be triggered by external events, referred to in this chapter as DMA requests.
- The TPCC schedules DMA transfers to the TPTC DMA engines (TPTC0 and TPTC1) through dedicated local interconnect 32-bit configuration ports.
- Each TPTC issues concurrent traffic on the local interconnect through dedicated read and write 64-bit ports.
- Interrupts generated by the DMA_DSP are routed to the INTC_DSP.
- Power-management handshakes are exchanged between DMA_DSP components and the SYSC.

Figure 5-7. DSP DMA Overview



5.3.3.1 Third-Party Channel Controller

The TPCC is the DMA_DSP transfer scheduler responsible for scheduling, arbitrating, and issuing user-programmed transfers to the two TPTCs.

5.3.3.1.1 TPCC Features

The TPCC features are:

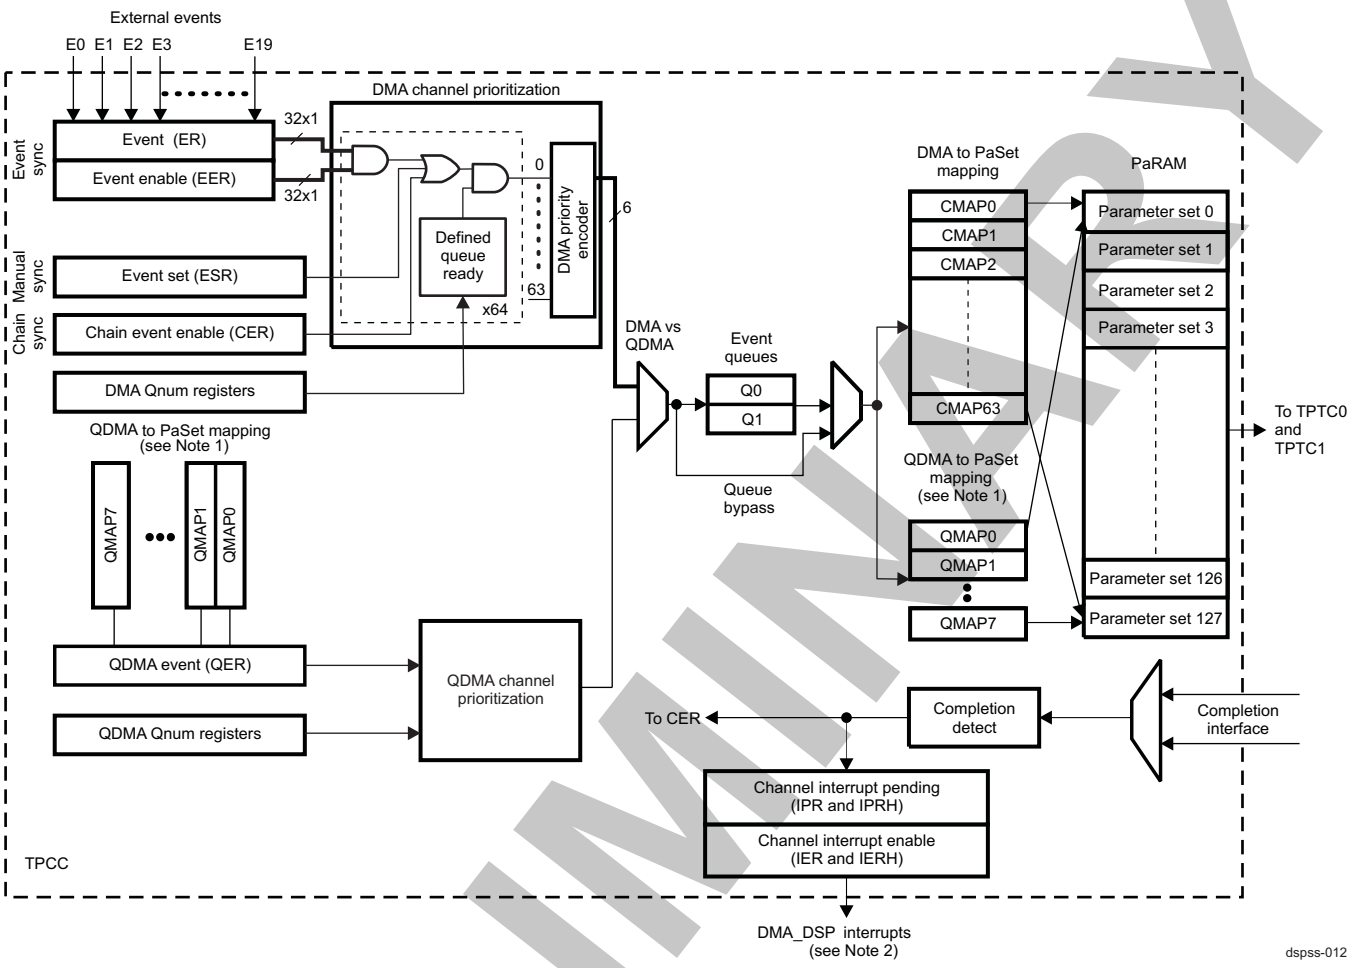
- Parameter RAM (PaRAM) entries, which hold up to 128 transfer contexts, with the following capabilities:
  - Ping-pong and circular buffering
  - Channel chaining
  - Auto-reloading

Each PaRAM entry can be used as a DMA entry (up to 64), QDMA entry (up to 8), or link entry (remaining):

- Up to 64 DMA logical channels:
  - 64 channels can be triggered explicitly by the DSP_C0 CPU (DMA entry).
  - 64 channels can be triggered by external events (see Table 5-3).
  - All channels can be triggered by completion of a previous transfer in a user-programmed chain of transfers (linked entry).
- 12 interrupt lines connected to the DSP_C0 CPU
- Boundaries for synchronization with the CPU are programmable.
- Two queues holding events waiting for submission to the TPTC
- Each transfer can be programmed to a priority level (three possible levels).

Figure 5-8 is a block diagram of the TPCC.

Figure 5-8. TPCC Block Diagram



(1) Although it is depicted twice in Figure 5-8, there is only one physical register set for the QDMA to PaRAM set mapping block.

(2) For more information, see Table 5-6.

A channel is a specific event that can cause a transfer to be submitted to the TPTCs as a transfer request. The TPCC supports up to 64 DMA channels and up to 8 QDMA channels. These channels are identical, except for how they are triggered:

- DMA channels can be triggered by external events (such as MCBSP TX Evt and MCBSP RX Evt) by the software writing 1 to a given bit location or channel, by the event set register, or through chaining.
- QDMA channels are triggered automatically (auto-triggered) by the CPU. QDMAs allow a minimum number of linear writes to be issued to the TPCC to force a series of transfers to occur.

The TPCC arbitrates among pending DMA and QDMA events with a fixed 64:1 and 4:1 priority encoder for these events, respectively (a low channel number corresponds to a high priority). DMA events are always higher priority than QDMA events. The higher-priority event is placed in the event queue to await submission to the transfer controller, which occurs at the earliest opportunity. Each event queue is serviced in FIFO order, with a maximum of 16 queued events per event queue. If more than one TPTC is ready to be programmed with a transmission request (TR), the event queues are serviced with fixed priority: Q0 is higher than Q1. When an event is ready to be queued and the event queue and the TC channel are empty, the event bypasses the event queue and goes directly to the PaRAM processing logic for submission to the appropriate TC. If the TR bus/PaRAM processing is busy, the bypass path is not used. The bypass is not used to dequeue for a higher-priority event.

Events are extracted from the event queue when the TPTC is available for a new TR to be programmed into the TPTC (signaled with the empty signal, indicating an empty program register set). As an event is extracted from the event queue, the associated PaRAM entry is processed and submitted to the TPTC as a TR. The TPCC updates the appropriate counts and addresses in the PaRAM entry in anticipation of the next trigger event for that PaRAM entry. The PaRAM entry consists of eight words of DMA context, including source address, destination address, count, indexes, etc.

5.3.3.1.2 DMA Versus QDMA

The only difference between a QDMA and a DMA transfer is the means of generating and recognizing TR synchronization. From the user point of view, DMA and QDMA transfer types can be combined to perform various types of transfers.

DMA channel TR synchronization can be generated from one of three sources:

- Event-triggered: The event register (TPCC_ER) channel *n* bit is set as the result of an external event. An external event is latched in the event register. If the corresponding event is enabled through the event enable register (TPCC_EER), this is recognized as a TR synchronization.
- Manually triggered: The event set register channel *n* bit is set manually to the event set registers (TPCC_ESR and TPCC_ESRH) for channel *n* (the TPCC_ESR[n] En bit or TPCC_ESRH[n] En bit). Manually set events do not have to be enabled to be recognized as a TR synchronization.
- Chain-triggered: The chain event register channel *n* (the TPCC_CER and TPCC_CERH registers) bit is set when a chaining completion code is detected on the completion interface for channel *n*. Chain events do not have to be enabled. If a chain trigger is detected, this is always recognized as a TR synchronization.

QDMA TR synchronization occurs in one of two ways:

- Auto-triggered: The QDMA event register channel *n* (the TPCC_QER and TPCC_QER_RN_k[n] En) bit is set when a CPU write address matches the address defined by the QDMA mapping register for channel *n* (TPCC_QCHMAPN_j) and the QDMA channel is enabled (the TPCC_QEER[n] En bit field).
- Link-triggered: The TPCC_QER[n] En bit is set when a link update is performed on a PaRAM address that matches the TPCC_QCHMAPN_j setting, and the TPCC_QEER[n] En bit is set.

There is a subtle difference between each trigger type and the associated enablers. Event assertion always results in the TPCC_ER[n] En bit being set, regardless of the state of the enable (TPCC_EER.En). It is recognized as a TR synchronization only if enabled. Chain triggering always sets the TPCC_CER[n] En bit and is always treated as a TR synchronization. Manual triggering always sets the TPCC_ESR[*n*] En bit and is always treated as a TR synchronization. Auto-triggering (QDMA) sets only the event register TPCC_QER[n] En bit only if the corresponding event is enabled (TPCC_QEER[n] En); when the TPCC_QER[n] En bit is set, it is always treated as a TR synchronization.

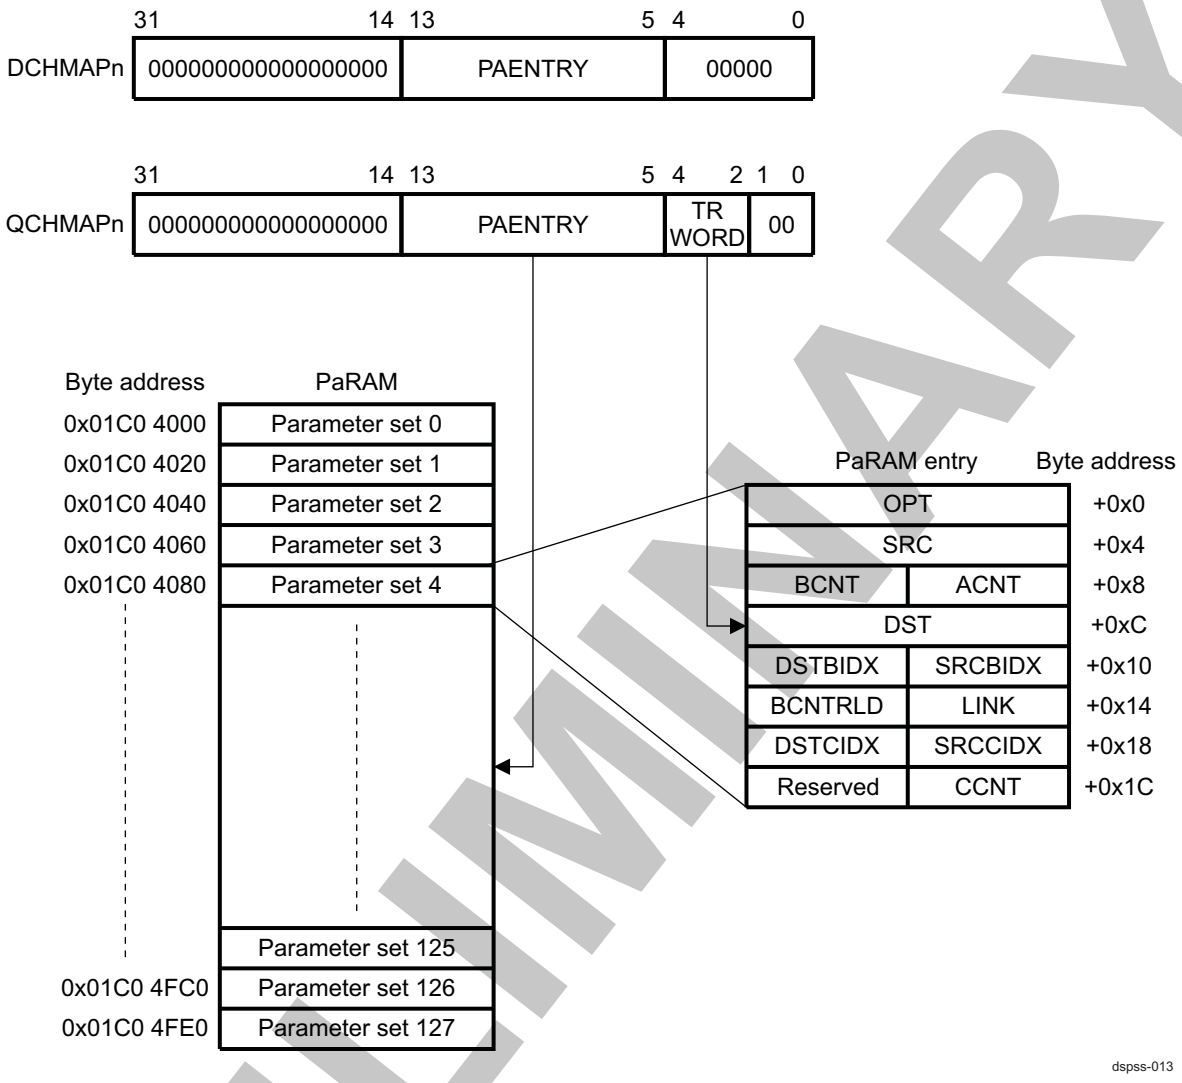
For more information, see Section 5.4, *DSP Subsystem Programming Guide*.

5.3.3.1.3 DMA/QDMA Channel Mapping and PaRAM Entry

The DMA and QDMA channel mapping registers (TPCC_DCHMAPN_i and TPCC_QCHMAPN_j) allow each DMA and QDMA channel to be mapped to arbitrary locations in the PaRAM memory map. The entry is designated with a 9-bit PAENTRY (the TPCC_DCHMAPN_i[13:5] PAENTRY and TPCC_QCHMAPN_j[13:5] PAENTRY bit fields) PaRAM entry number that defines the entry number in a 128-entry maximum PaRAM (see Figure 5-9). The TPCC_QCHMAPN_j[4:2] TRWORD bit field points to the trigger word of the PaRAM entry defined by PAENTRY. A write to the trigger word results in a QDMA event being recognized.

Figure 5-9 shows DMA/QDMA channel mapping and PaRAM entry.

Figure 5-9. DMA/QDMA Channel Mapping and PaRAM Entry



NOTE: Each parameter entry of PaRAM is organized as eight 32-bit words or 32 bytes, as shown in Figure 5-9.

The location of fields in each entry, and the bit positions in the options field, must match the TR packet format as closely as possible to the requirements of the TPTC0 and TPTC1 programming. Each PaRAM entry consists of 16- and 32-bit parameters that correspond to the transfer geometry. For more information about the parameters, see Section 5.3.3.1.2, *DMA Versus QDMA.*

5.3.3.1.4 Types of TPCC Transfers

The TPCC streamlines transfers into an orthogonal transfer structure that is always defined by three dimensions. Of the three dimensions, only two synchronization types are supported: 1D synchronized transfers and 2D synchronized transfers; three-dimensional (3D) synchronized transfers can be logically achieved by chaining.

The following terms are used:

- 1D transfer or array: ACNT contiguous byte transfer. For information about the 1D transfer programming model, see Section 5.3.3.1.5, *Transfer Synchronization*.
- 2D transfer or frame: BCNT arrays of ACNT byte transfer. Each array transfer in 2D transfer is

separated from other transfers by an index programmed through the TPCC_BIDX_m register.

- 3D or block: CCNT frames of BCNT arrays of ACNT bytes. Each transfer in 3D is separated from the previous transfer by an index programmed by the TPCC_CIDX register. The reference point for the index depends on the synchronization type.

5.3.3.1.5 Transfer Synchronization

In a 1D synchronized transfer, each TPCC TR synchronization triggers the transfer of the first dimension of ACNT bytes, or one array of ACNT bytes. In other words, each TR packet consists of transfer information for only one array. Arrays can be separated by SBIDX and DBIDX (see Figure 5-9) where the start address of array N equals the start address of array 1 plus SRC or DST BIDX. Frames can be separated by SCIDX and DCIDX. For 1D synchronized transfers, after the frame is exhausted, the address is updated by adding (S|D)CIDX to the beginning address of the last array in the frame.

Contrast this to the (S|D)CIDX update in 2D synchronized transfers, which are referenced from the beginning address of the first array in the previous frame. For information about parameter updates, see Section 5.3.14, *Error Reporting*.

In a 2D synchronized transfer, each TR synchronization triggers the transfer of two dimensions or one frame. In other words, each TR packet conveys information for one entire frame of BCNT arrays of ACNT bytes. Arrays can be separated by SBIDX and DBIDX (see Figure 5-11). Frames can be separated by SCIDX and DCIDX. For 2D synchronized transfers, after a TR for the frame is submitted, the address is updated by adding (S|D)CIDX to the beginning address of the beginning array in the frame. Contrast this to the (S|D)BIDX update in 1D synchronized transfers. For information about parameter updates, see Section 5.3.14, *Error Reporting*.

5.3.3.1.6 DMA Channel Prioritization

If multiple trigger sources (event trigger/chain trigger/manual trigger) for a single channel are active at the same time, the TPCC services events in the following order:

1. Event trigger (through the event register [ER])
2. Chain trigger (through the chain event register [CER])
3. Manual trigger (through the event set register [ESR])

5.3.3.1.7 Transfer Completion

Transfer completion can be used for two different mechanisms in the TPCC:

- Generating chained events
- Generating interrupts to an external processor

The underlying mechanism for both features is the same. The user programs the PaRAM options field with a specific transfer completion code (the TPCC_OPT_m[17:12] TCC bit field) and indicates whether that completion code is to be used to generate a chained event and/or an interrupt when a transfer completes. The user can selectively program whether completion signaling is enabled for the final TR of a PaRAM set, for all except the final TR of a PaRAM set, or for all TRs of a PaRAM set. The specific TCC value (6-bit binary value) programmed by the user dictates which bit of the 64-bit CER and/or interrupt pending register (IPR) is used.

There is no direct correlation between the TCC value used for a specific PaRAM entry and the channel number for that entry. Software controls the allocation of TCC values. There is always a 1:1 relationship between the value of the TCC and the IPR bit and/or the CER bit set when that transfer completes. For example, completion of the PaRAM entry for channel 0 can chain-trigger the PaRAM entry for channel 1.

5.3.3.2 Third-Party Transfer Controller

The TPTC is the DMA_DSP transfer engine that generates transfers as programmed in dedicated working registers, using two dedicated master ports: a read-only port and a write-only port.

NOTE: The port data bus width of the instances of the TPTC is fixed at 64 bits.

5.3.3.2.1 TPTC Features

The TPTC features:

- Pipelined transfers (multiple in-flight transfers)
- Background programming
- 2D or 1D transfer
- Increment addressing modes
- Clock-stop handshaking with the SYSC
- Programmable tracking of transfer completion
- 2D qualifications of transfers to allow 2D bandwidth optimization

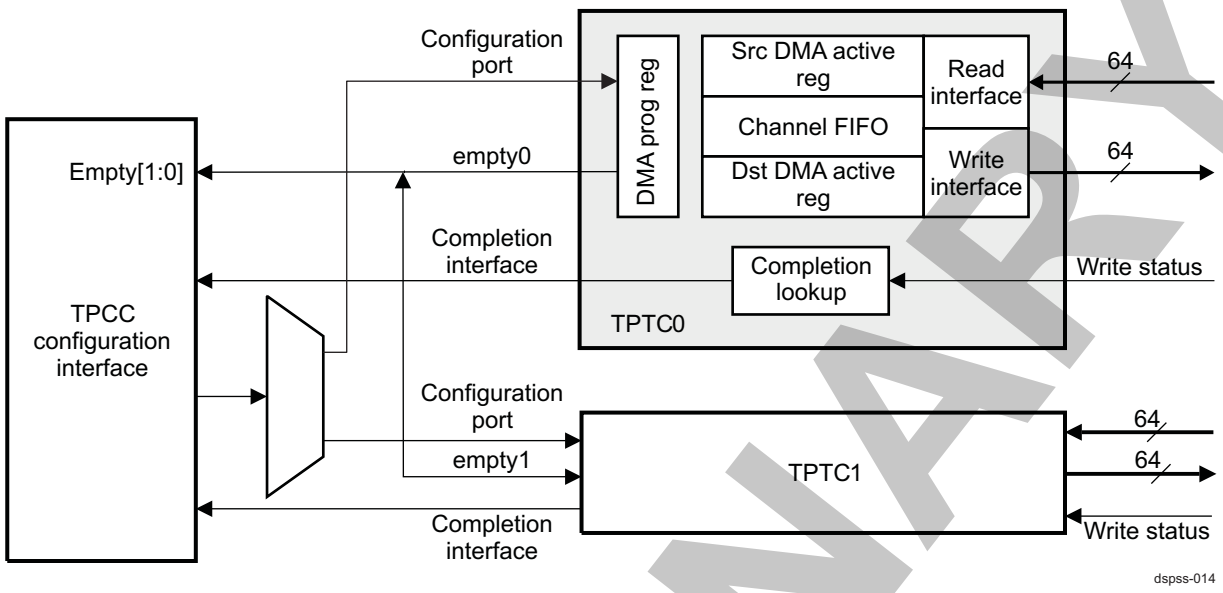
Two instances of the TPTC generate concurrent traffic on the DSP local interconnect. Each TC controller consists of the following components:

- DMA_DSP program register set: Stores the context for the DMA transfer that is loaded into the active register set when the current active register set completes. The CPU or TPCC programs the program register set, not the active register set. For a typical stand-alone operation, the CPU programs the program register while the TC services the active register set. The program register set includes ownership control that synchronizes the CPU software and the DMA_DSP.
- Source DMA_DSP active register set: Stores the context (src/dst/cnt/, etc.) for the DMA transfer request in progress in the read controller. The active register set is split into independent source and distant register, because the source local interconnect controller and the distant local interconnect controller operate independently of one another.
- Distant DMA_DSP register set: Stores the context (src/dst/cnt/, etc.) for the DMA transfer request in progress or pending in the write controller. The pending register sets must allow the source controller to begin processing a new TR while the distant register set processes the previous TR.
- Channel FIFO: Temporary holding buffer for in-flight data. The read return data of the source peripheral is stored in the data FIFO, and then is written to the destination peripheral by the write command/data bus.
- Read controller/local interconnect read interface: The local interconnect read interface issues optimally sized read commands to the source peripheral, based on a burst size of 64 bytes and available landing space in the channel FIFO.
- Write controller/local interconnect write interface: The local interconnect write interface issues optimally sized write commands to the destination peripheral, based on a burst size of 64 bytes and available data in the channel FIFO.
- Completion interface: Sends completion information to the TPCC for posting interrupts in the TPCC.
- Configuration port: Slave interface that provides read/write access to program registers and read access to all memory-mapped TC registers. For information about TPTC registers, see Section 5.3.1, *DSP Subsystem Register Manual*.

Table 5-4 lists the hardware settings.

Figure 5-10 shows the internal structure of the TPTC and its connection to the TPCC.

Figure 5-10. TPTC Block Diagram



The primary responsibility of the TPTC is to perform read and write transfers through the local interconnect to the slave peripherals, as programmed in the active and program register sets:

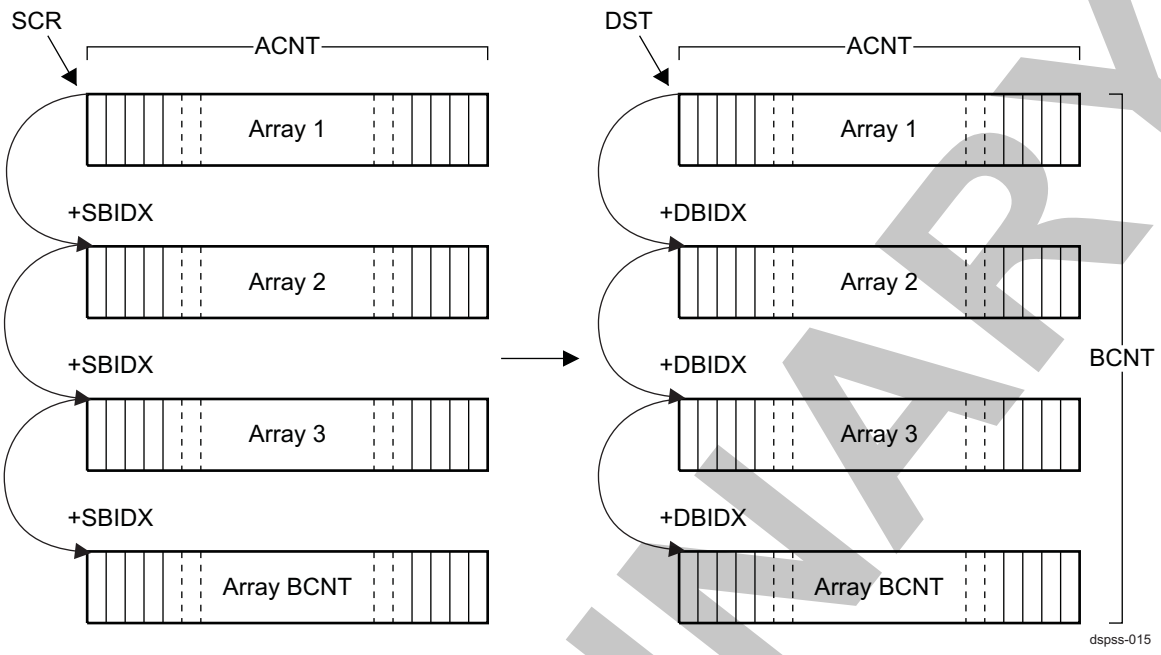
- In the TC stand-alone use model, the user directly programs the program and active register sets for a given channel (TPTC0 or TPTC1). Because of the TPCC, this mode is not the use case targeted for device applications; therefore, it is not emphasized in this chapter. For information about its programming model, see Section 5.4.3.5.5, *Direct Configuration to Transfer Channel (Not Recommended)*.
- In the TC external-control use model, the user does not directly program the active and program register sets. Instead, the TPCC is the user interface to the DMA_DSP system, and the TPTCs (TPTC0 and TPTC1) are slaves to the TPCC. This is the use case of the DMA_DSP in device applications.

5.3.3.2.2 Transfer Geometry

The TPTC supports a transfer geometry fully defined by the registers summarized here (see Figure 5-11):

- OPTx: Options, where x = 0 or 1
  - SAM: Source address mode; controls whether the source array is from incrementing addresses or from one FIFO address
  - DAM: Distant address mode; controls whether the destination array is to an incrementing address or to one FIFO address
  - FWID: Controls the width of the FIFO
- SRC: Source address
- DST: Distant address
- CNT: BCNT, ACNT
  - ACNT: Number of bytes in each array
  - BCNT: Number of arrays in each TR
- BIDX: DBIDX, SBIDX
  - SBIDX: Source B-dimension index; defines the address offset between starting addresses of each source array
  - DBIDX: Distant B-dimension index; defines the address offset between starting addresses of each destination array

Figure 5-11. Transfer Geometry



NOTE: Many TI DMA controllers employ a concept of element size and element indexing. To maintain orthogonality, the concept of element size has been dropped. An element-indexed transfer is logically achieved by programming ACNT to the size of the element, and programming BCNT to the number of elements that must be transferred.

5.3.3.2.3 Tracking Transfers

Each TPTC channel consists of three register sets: a program register set and a source-active register set. The status of each of these register sets is indicated by the PROGBUSY, SRCACTV, DSTACTV, and WSACTV status bits, which are user-readable in the TPTC_TCSTAT register.

The program register set (TPTC_POPT, TPTC_PSRC, TPTC_PCNT, TPTC_PDST, TPTC_PBIDX, and TPTC_PMPPRXY) is never modified by the TPTC, because it is simply holding registers processed by the active register set. The source active register set (TPTC_SAOPT, TPTC_SASRC, TPTC_SACNT, TPTC_SADST, TPTC_SABIDX, TPTC_SAMPPRXY, TPTC_SACNTRLD, TPTC_SASRCBREF, and TPTC_SADSTBREF) tracks commands for the source side of the transfer.

As the source controller processes a TR, the SRC, DST, and CNT fields must be continuously updated as commands are issued. A reference value for these registers is also maintained. The active register set uses the reference address (SRCBREF and/or DSTBREF) to calculate the addresses of subsequent arrays in a transfer. This is required because subsequent arrays are defined as an offset from the starting address of the current array. Similarly, when a new array begins, the CNT must be restored (from CNTRLD) to the originally programmed value and decremented as the new array is processed.

The following summarizes the use of the active register sets:

- Static fields:
  - OPT
  - BIDX: DBIDX/SBIDX
- Dynamic fields:
  - SRC: Source address of the next read command to be issued
    - Tracked by the source active register set
  - DST: Distant address of the next write command to be issued
    - Tracked by the distant FIFO register set

  - CNT: BCNT/ACNT
    - BCNT: Number of arrays remaining to be transferred. This includes the current array; that is, BCNT is decremented after all commands for an array are issued (or at least after all read or write commands are scheduled).
    - ACNT: Number of bytes remaining to be transferred
    - Tracked independently in the source and distant FIFO register sets
- Reference fields:
  - CNTRLD: ACNTRLD only
    - CNTRLD.ACNTRLD is set with the initial value of CNT.ACNT. The reload value is copied into CNT.ACNT when CNT.ACNT decrements to 0.
    - Tracked independently in the source and distant FIFO register sets

    Because a command is complete when BCNT decrements to 0, there is no reload value for BCNT.
  - SRCBREF: Source address reference points to the starting address of the array being read. The starting address of the next array is calculated as SRCBREF + SBIDX.
    - Tracked by the source active register set
  - DSTBREF: Distant address reference points to the starting address of the array being written. The starting address of the next array is calculated as DSTBREF + DBIDX.
    - Tracked by the distant FIFO register set

5.3.3.2.4 Completion Interface to TPCC

If TCINTEN or TCCHEN is set to 1, the TPTC must return completion information when the entire TR completes. The TPCC uses the completion information for chaining (enabled by TCCHEN) or posting interrupts (enabled by TCINTEN).

The TPTC generates status conditions based on the completion of a transfer (the TPTC_INTSTAT[1] TRDONE bit) and on the program register set transitioning to the downstream registers (the TPTC_INTSTAT[0] PROGEMPTY bit).

These two conditions can be enabled by the corresponding bits in the TPTC_INTEN register to generate an interrupt to the DSP_C0 CPU through the TCERRINTx interrupt line (TCERRINT0 for TPTC0, and TCERRINT1 for TPTC1). For the event mapping of these interrupt lines, see Table 5-3.

NOTE: The TRDONE and PROGEMPTY status bits are always available and are stored in the TPTC_INTSTAT register, regardless of the use model and regardless of whether the corresponding bits are enabled. Typically, these bits are used not in the TPCC use model, but in a stand-alone use model in which the user directly programs the TC.

For more information about DMA_DSP completion and its programming model, see Section 5.4.3.1, *Transfers From/to Device Memories/Peripherals (DMA_DSP)*.

5.3.3.3 DSP DMA Hardware Parameters

Table 5-4 lists the hardware parameter settings for the DSP subsystem.

Table 5-4. DMA_DSP Hardware Parameters

Module		Parameter	DSP Subsystem
DMA_DSP	TC	FIFO size for TC0	256 bytes
		FIFO size for TC1	128 bytes
		Data bus width	64 bits
		TR pipelining depth TC0	4
		TR pipelining depth TC1	2
		Endianness	Little
		Burst size	64

Table 5-4. DMA_DSP Hardware Parameters (continued)

Module		Parameter	DSP Subsystem
	CC	Number of DMA channels	64
		Number of QDMA channels	8
		Number of PaRAM entries	128
		Number of Event Qs	2
		Number of TPTCs	2

NOTE: The TR pipelining depth controls the number of read TRs for a given transfer channel that can be serviced by the source transfer controller without being serviced by the distant transfer controller. This dictates the amount of storage required in the distant queue channel registers for in-flight TRs.

The user cannot directly program burst size, as with the system DMA (DMA_SYSTEM), but must rely on the ACNT/BCNT and issue 1D synchronization transfers to do so.

5.3.4 DSP MMU on L3_MAIN Interconnect

The MMU_DSP (the DSP subsystem level MMU with port on L3_MAIN interconnect) communicates accesses from the DSP core - DSP_C0 of the DSP subsystem to the L3_MAIN interconnect, mapping the 4 GiB of the DSP virtual addresses to any place in the 4-GiB address space of the device.

At reset, the MMU_DSP is disabled, and the DSP core CPU, i.e. DSP_C0, can access global memory mapping in the device from the 0x1100 0000 address. Addresses in the range of 0x0000 0000 to 0x10FF FFFF can be reached only by the DSP_C0, because it performs its own internal memory mapping. For more information, see Section 2.2, *L3_MAIN Memory Space Mapping* in Chapter 2, *Memory Mapping*.

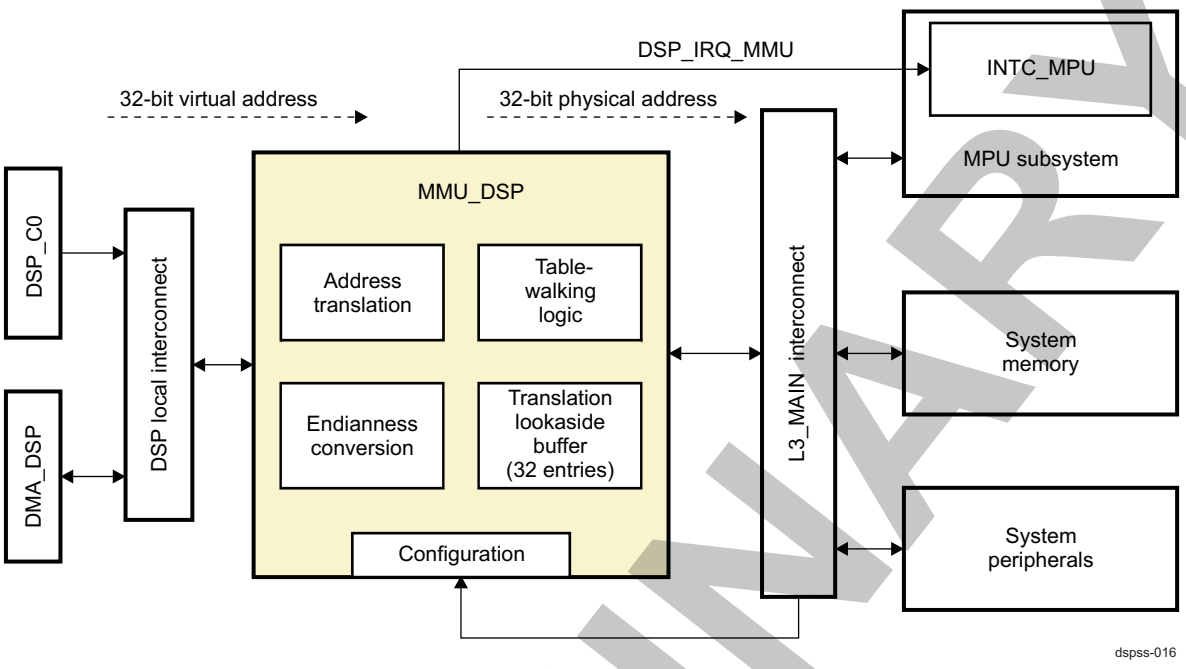
The MMU_DSP features:

- 32 entries/fully associative translation lookaside buffer (TLB)
- One interrupt line to the MPU
- 32-bit virtual addresses, 32-bit physical addresses
- 4-KiB, 64-KiB, 1-MiB, and 16-MiB pages
- Predefined (static), software-driven (interrupt-based), or table-driven (hardware table-walker) software translation strategies
- 2-level descriptor hierarchy
- One intermediate page table
- Fault status and fault address register

NOTE: The endianness conversion capability of the MMU_DSP is not used in the DSP subsystem (the DSP is configured as a little-endian processor in the device). With this configuration, the setting of the MMU_RAM[9] ENDIANNESS bit is ignored, even if the user changes the value. For more information, see Chapter 20, *Memory Management Units*.

Figure 5-12 shows the integration and functionality of the MMU_DSP.

Figure 5-12. DSP MMU Block Diagram



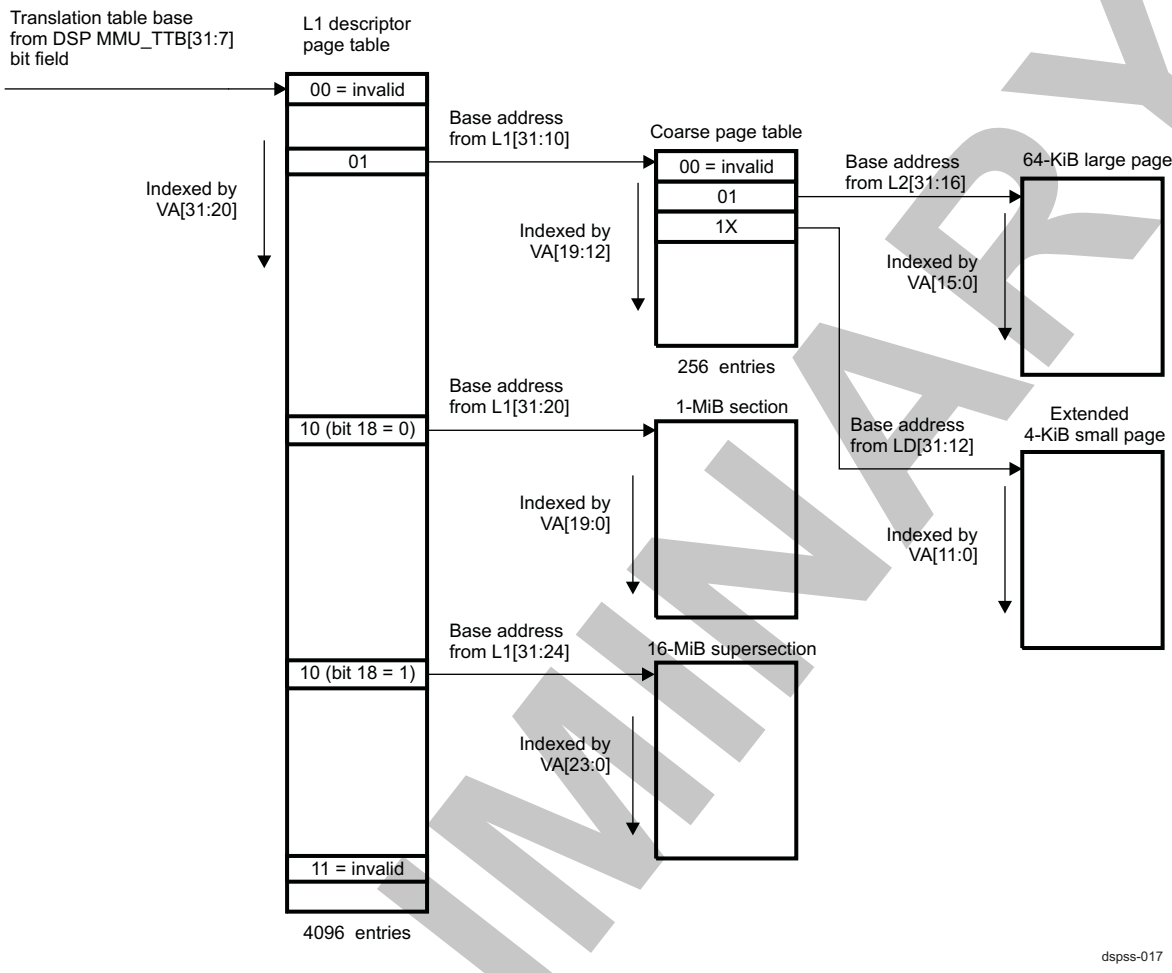
5.3.4.1 DSP MMU VA-to-PA Translation

The MMU_DSP translates the 32-bit DSP external addresses to physical addresses in the 32-bit MPU address space. Address translation is performed by a translation table base (TTB) structure that maps the most-significant bits (MSBs) of the DSP byte address to another set of MSBs of a 32-bit MPU byte address. The least-significant bits (LSBs) of the DSP-generated byte address are used as page/section indices in the address translations and are not altered when forming the new 32-bit physical address. The TTB translations are expedited by a TLB that serves as a cache of recently used page translations. The address mapping can be programmed at the TTB level or by writing the TLB entries directly. The MMU_DSP contains 32 TLB entries that can be configured to remap 4-KiB, 64-KiB, 1-MiB, or 16-MiB segments of memory.

The TLB can be managed statically or dynamically (through the use of interrupts) by the MPU OS, but the MMU_DSP also includes hardware table-walking logic that lets it autonomously traverse the page table on a TLB miss. On a TLB miss, the translation table-walking logic automatically retrieves the information from the translation table stored in physical memory and updates the TLB cache.

Figure 5-13 shows the TTB structure in detail.

Figure 5-13. DSP MMU Translation Table Hierarchy



NOTE: The MMU_DSP passes the lower bits of the virtual address unchanged.

5.3.4.2 DSP MMU Configuration

If the MMU_DSP requires software intervention, the MPU services the event; MMU_DSP service requests are signaled to the MPU with a dedicated interrupt (see Table 5-3).

Generally, the MMU_DSP is initialized at boot time, but it can also be dynamically reprogrammed. Typically, the MMU_DSP is programmed by the device MPU through the DSP slave L4_CFG port on the L3_MAIN interconnect when a new task is created on the DSP subsystem. However, the DSP also has access to the MMU_DSP configuration registers for the save-and-restore process. At reset, the MMU_DSP is disabled and DSP virtual addresses are passed directly through as physical addresses (not translated).

For more information about the functions of the MMU_DSP in the DSP subsystem, including interrupts, register descriptions, and programming model, see Chapter 20, *Memory Management Units*.

5.3.5 Clock Configuration

The DSP subsystem receives one clock signal from the PRCM module (see Table 5-2).

Generation of these clocks is handled internally to the DSP subsystem by the SYSC module under direct control of the PRCM module.

Table 5-5 lists the clock domains in the DSP subsystem and the roles of the clocks.

Table 5-5. DSP Internal Clock

Clock Domain	Clock	Description
CD0	CD0_CLK	DSP_C0 + PMC + DMC + L1/L2 caches + SCTM
CD1	CD1_CLK	Power-down logic (WUGEN_DSP) + INTC_DSP + external interfaces + DSP megamodule external interfaces + local interconnect + DMA_DSP + MMU_DSP + SYSC

NOTE: The internal clocks can be shut down by the PRCM module after the handshake protocol is complete. For more information, see Section 3.1.1.1.2, *Module-Level Clock Management* in Chapter 3, *Power, Reset, and Clock Management*.

5.3.6 Hardware and Software Resets

5.3.6.1 Hardware Resets

See Table 5-2 for more information on the following reset signals:

- DSP_RST: Connected to the DSP megamodule and the DMA_DSP module
- DSP_WGN_RST: Connected to the DSP subsystem WUGEN module - WUGEN_DSP
- DSP_RET_RST: Connected to most of the blocks of the DSP subsystem. It resets the DSP subsystem logic, including the cache valid bits, cache enable bits, INTC_DSP, and some registers in the MMU_DSP.
- DSP_PWRON_RST: Performs a power-on initialization of the DSP subsystem logic

After chip power on, the DSP subsystem is kept under reset and only the DSP_RET_RST signal is released from reset. Then, only the WUGEN_DSP is released from reset as part of the CORE power domain. The DSP subsystem remains under reset until the MPU clears the DSP reset bit (see Section 3.5.4 , *Reset Domains* in Chapter 3, *Power, Reset, and Clock Management*). On this action, the PRCM module switches on the DSP power domain, sets the clocks back, and releases the power-on reset (POR). When the DSP power-on sequence completes (hardware handshake), the PRCM module releases the reset signal. At this stage, the DSP megamodule is kept under reset; the MPU can upload some code and data in the C64x+ memory. When the MPU has uploaded the code in the C64x+ memory, it releases the DSP megamodule from reset. At this point, the sequencer is kept under reset; the DSP can upload some code and data in the sequencer memory. When the DSP has uploaded the code in the sequencer memory, the DSP releases the sequencer from reset.

5.3.6.2 Software Resets

DSP subsystem reset signals are sourced from the PRCM module. Some modules of the DSP subsystem can also be reset by software control.

The MPU can apply a software reset to the DSP. For a software reset to be safe, the DSP subsystem must be in clock-off mode (DSP is in idle mode with clocks shut down by the PRCM module; for information about the clock-off state transition, see Section 5.4.6.3, *Power-Down and Wake-Up Management*). For instance, the MPU can use a mailbox interrupt to ask the DSP subsystem to go into IDLE state.

For some detected severe issues or if the user applies an external system reset, the DSP can receive a warm reset. All reset signals except POR are applied.

For more information on the DSP reset bits, see Section 3.7.2, *PD_DSP Description*, in Chapter 3, *Power, Reset, and Clock Management*.

NOTE: Software reset can be applied only while the DSP subsystem is in clock-off mode.

The WUGEN_DSP reset signal (DSP_WGN_RST) is reset with the CORE power domain, which is reset when global cold or global warm reset events occur. For more information about global reset sources, see Section 3.5.4, *Reset Domains* in Chapter 3, *Power, Reset, and Clock Management*.

For more information about software resets, see Section 5.4.6.2, *Reset Management*.

5.3.7 Interrupt Requests

The DSP subsystem manages three types of interrupts (see Figure 5-14):

- Internal interrupts: Requests generated by modules in the DSP subsystem or in the DSP megamodule
- External interrupts: Requests generated by peripherals external to the DSP subsystem, such as serial port interface (SPI), display subsystem, or camera subsystem. Peripherals that generate interrupts at the DSP level use the D_IRQ_k input lines of the DSP subsystem.
- MMU_DSP interrupt: The DSP MMU on L3_MAIN interconnect can generate an interrupt to an external host outside the DSP subsystem. As shown in Figure 5-2, the interrupt line of the MMU_DSP (DSP_IRQ_MMU) is connected to the MPU interrupt controller - INTC_MPU.

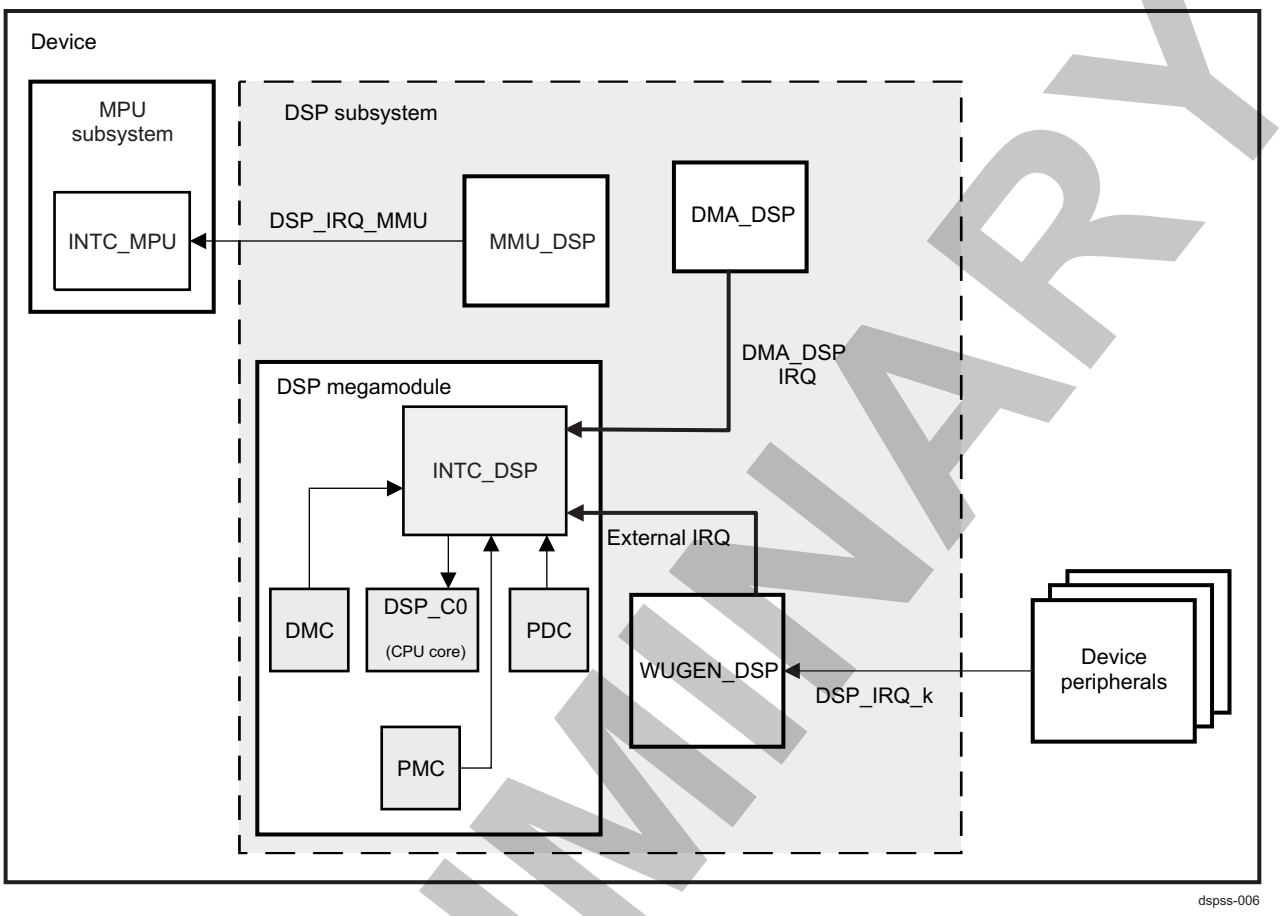
For more information about the functions of the MMU_DSP, see Section 5.3, *DSP Subsystem Functional Description*.

To manage and expand the interrupt capabilities of the DSP megamodule (internal and external interrupt requests), the DSP subsystem includes two levels of interrupt control (see Figure 5-14):

- One INTC_DSP, integrated in the DSP megamodule. This module controls all interrupt requests (internal and external), except the MMU_DSP interrupt.

  For more information about the INTC_DSP, see Section 5.3.2.6, *DSP INTC*.
- One wake-up generator - WUGEN_DSP: Responsible at the DSP subsystem level for detecting wake-up events (interrupts, DMA requests, and slave port access) when the DSP subsystem is powered down (note that this may be a DSP low-power state under which DSP logic is still powered ON). The WUGEN_DSP also handles formatting interrupts from device peripherals to the DSP megamodule interrupt controller - INTC_DSP.

Figure 5-14. DSP Subsystem Interrupt Management



In addition to interrupt sources internal to the DSP subsystem, several interrupt sources coming from device peripherals are connected to the DSP megamodule interrupt controller - INTC_DSP, but not directly.

These external interrupt sources are resynchronized in the WUGEN_DSP, synchronously with the CD1_CLK clock, and then they are connected to the INTC_DSP.

Table 5-6 lists the global interrupt mappings of the DSP subsystem.

Table 5-6. DSP Interrupt Mappings

EVT	Interrupts/Events	DSP Subsystem Pin Name	Interrupt Source	Description
DSP_IRQ_0	EVT0	N/A (internal)	INTC_DSP	Output of event combiner 0, for events 4-31
DSP_IRQ_1	EVT1	N/A (internal)	INTC_DSP	Output of event combiner 1, for events 32-63
DSP_IRQ_2	EVT2	N/A (internal)	INTC_DSP	Output of event combiner 2, for events 64-95
DSP_IRQ_3	EVT3	N/A (internal)	INTC_DSP	Output of event combiner 3, for events 96-127
DSP_IRQ_4-8	Reserved	N/A (internal)	INTC_DSP	Reserved
DSP_IRQ_9	EMU_DTDMA	N/A (internal)	INTC_DSP	ECM interrupt (host scan access, DTDMA)
DSP_IRQ_10-14	Reserved	N/A (internal)	INTC_DSP	Reserved
DSP_IRQ_15	ABE_IRQ_DSP	D_WUGEN_0	INTC_DSP	ABE interrupt
DSP_IRQ_16	MMC1_IRQ	D_WUGEN_1	INTC_DSP	MMC/SD module 1 (L3_MAIN initiator)

Table 5-6. DSP Interrupt Mappings (continued)

EVT	Interrupts/Events	DSP Subsystem Pin Name	Interrupt Source	Description
DSP_IRQ_17	MMC2_IRQ	D_WUGEN_2	INTC_DSP	MMC/SD module 2 (L3_MAIN initiator)
DSP_IRQ_18	Reserved	D_WUGEN_3	INTC_DSP	Reserved
DSP_IRQ_19	Reserved	D_WUGEN_4	INTC_DSP	Reserved
DSP_IRQ_20	Reserved	D_WUGEN_5	INTC_DSP	Reserved
DSP_IRQ_21	Reserved	D_WUGEN_6	INTC_DSP	Reserved
DSP_IRQ_22	Reserved	D_WUGEN_7	INTC_DSP	Reserved
DSP_IRQ_23	Reserved	D_WUGEN_8	INTC_DSP	Reserved
DSP_IRQ_24	Reserved	D_WUGEN_9	INTC_DSP	Reserved
DSP_IRQ_25	Reserved	D_WUGEN_10	INTC_DSP	Reserved
DSP_IRQ_26	ELM_IRQ	D_WUGEN_11	INTC_DSP	Error location process completion
DSP_IRQ_27	CCAET	N/A (internal)	INTC_DSP	TPCC AET event
DSP_IRQ_28	Reserved	N/A (internal)	INTC_DSP	Reserved
DSP_IRQ_29	CCINTG	N/A (internal)	INTC_DSP	TPCC global interrupt
DSP_IRQ_30	CCINT3	N/A (internal)	INTC_DSP	TPCC region 3 interrupt
DSP_IRQ_31	CCINT4	N/A (internal)	INTC_DSP	TPCC region 4 interrupt
DSP_IRQ_32	CCINT5	N/A (internal)	INTC_DSP	TPCC region 5 interrupt
DSP_IRQ_33	CCINT6	N/A (internal)	INTC_DSP	TPCC region 6 interrupt
DSP_IRQ_34	CCINT7	N/A (internal)	INTC_DSP	TPCC region 7 interrupt
DSP_IRQ_35	CCINT8	N/A (internal)	INTC_DSP	TPCC region 8 interrupt

The interrupts generated by the WUGEN_DSP (interrupts from device peripherals) are programmable using a set of registers accessible by the user.

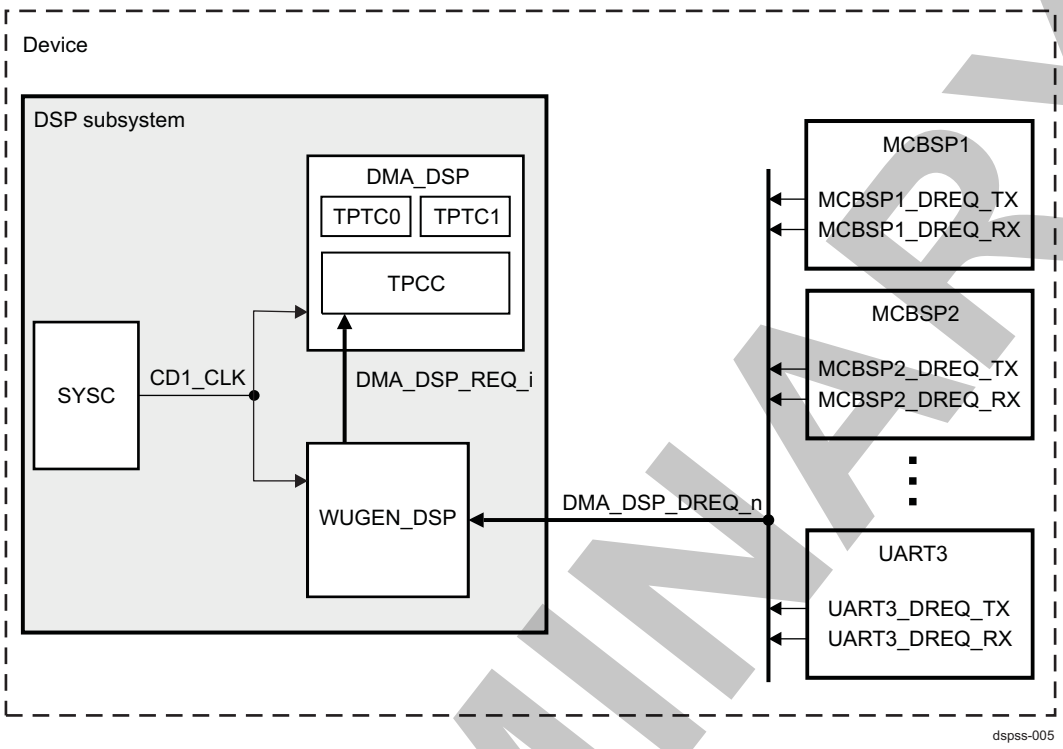
Events related to these external interrupts can be masked by writing to registers WUGEN_MEVTSET0 through WUGEN_MEVTSET4. The interrupts can also be individually unmasked by using registers WUGEN_MEVTCLR0 through WUGEN_MEVTCLR4. By default (after power on), these external interrupts are masked in the WUGEN_DSP.

All other interrupts are directly managed by the INTC_DSP, and the DSP registers are set. For information about the INTC_DSP, see the documents listed in Section 5.3.2.7, *Other DSP Reference Documents*.

5.3.8 DMA Requests

The DSP subsystem receives DMA requests from specific peripherals, such as the multichannel buffered serial port (MCBSP) module and the universal asynchronous receiver/transmitter (UART) module (see Figure 5-15).

Figure 5-15. DSP DMA Requests



For a description of the DMA_DSP controller, see Section 5.3.3, *DSP DMA*.

For the DMA request mappings to the DSP subsystem DMA_DSP controller, see Table 5-3.

NOTE: All DMA_DSP requests are shared DMA requests, and they are mapped on the DMA_SYSTEM. For more information, see Section 16.5, *DMA_SYSTEM Basic Programming Model* in Chapter 16, *DMA_SYSTEM*.

For more information about DMA request management, see Section 5.4.3.2, *Programming an DMA_DSP Transfer*.

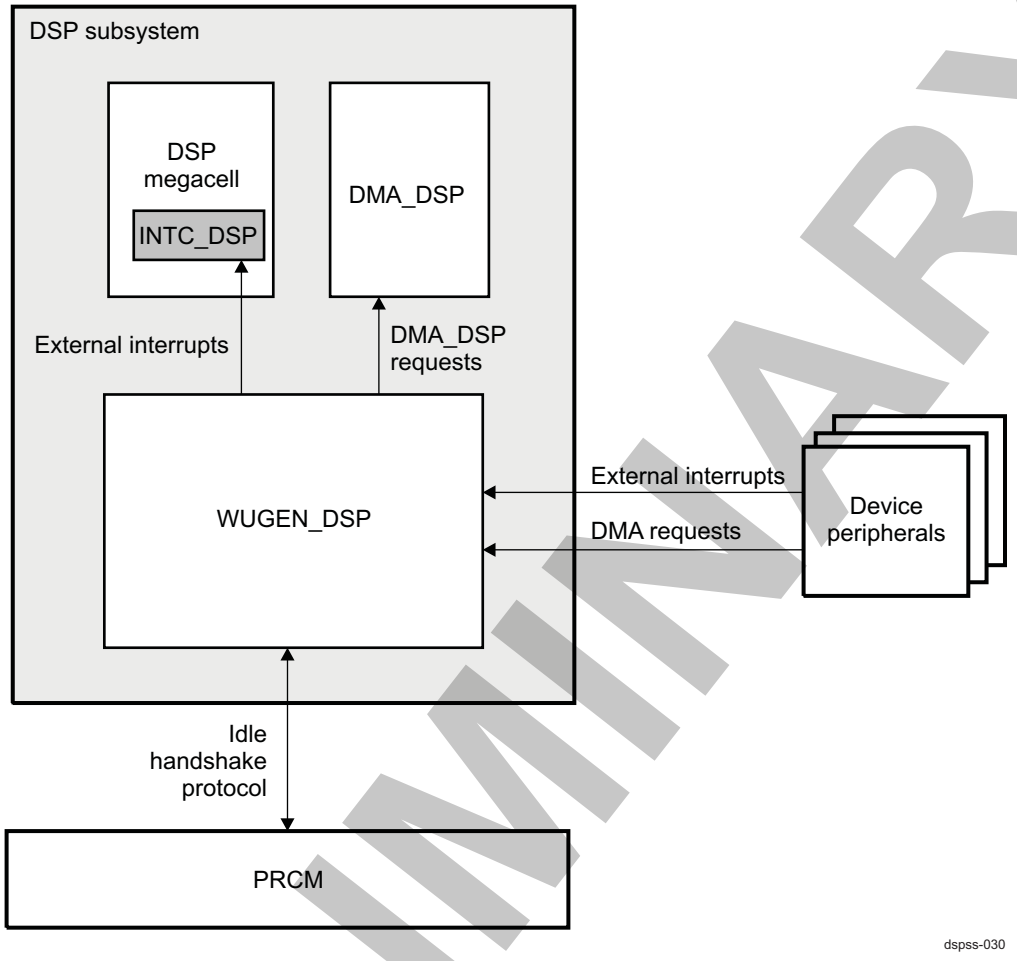
5.3.9 Wake-Up Generator

The WUGEN_DSP controls the following:

- Implementing the DSP idle handshake protocol with the PRCM module
- Resynchronizing interrupts and DMA requests from device peripherals external to the DSP subsystem
- Blocking the interrupts and DMA requests to the DSP on clean boundaries, when the WUGEN_DSP is asked to go into IDLE state
- Detecting the enabled wake-up interrupts and DMA requests and generating a wake-up event to the PRCM module
- Formatting interrupts to the DSP megamodule interrupt format

Figure 5-16 shows the WUGEN_DSP in the DSP subsystem and its interactions with other submodules.

Figure 5-16. DSP WUGEN Description



5.3.9.1 Interrupts, DMA Requests, and Event Management

Interrupts and DMA requests are generated in the same way in the WUGEN_DSP. In this section, both are called events.

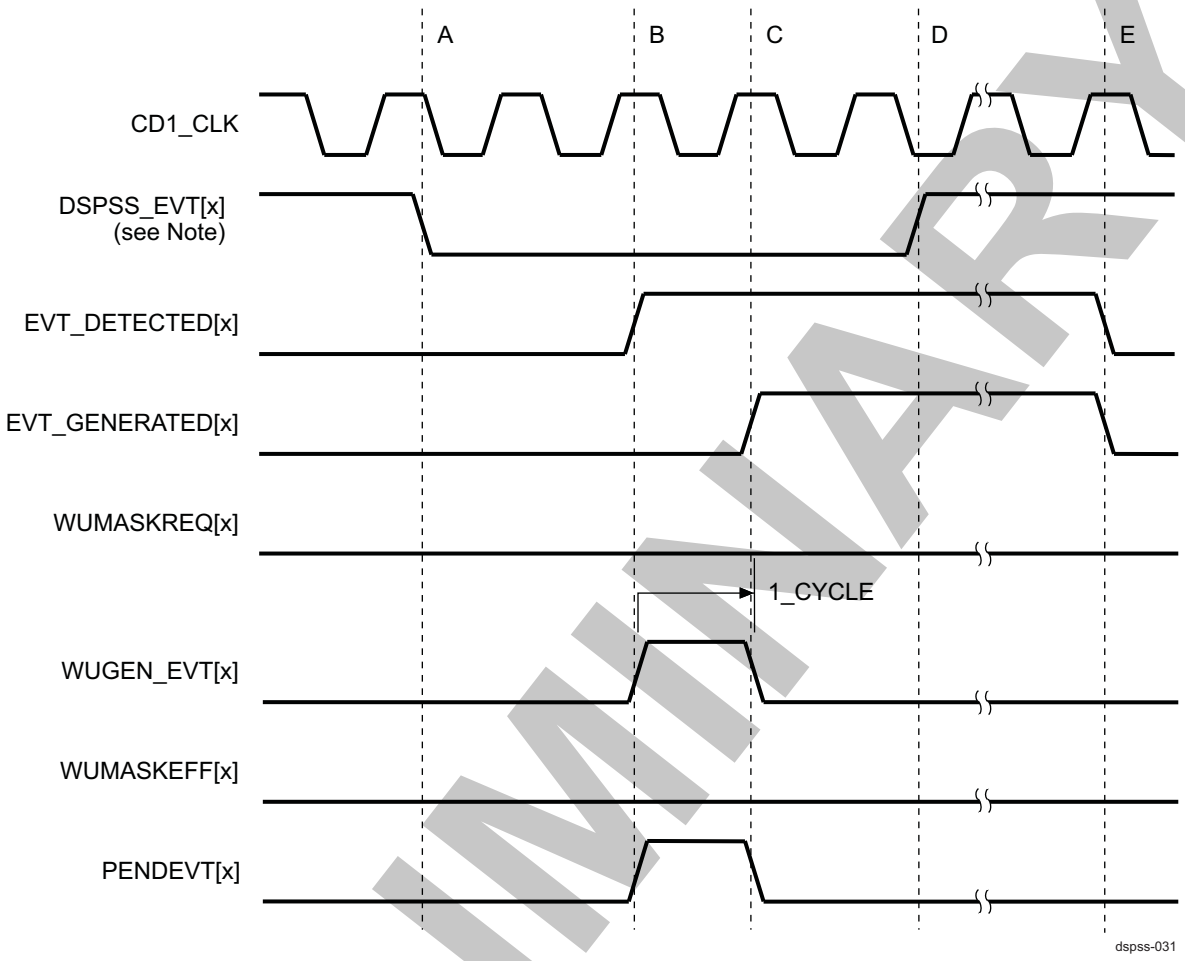
To manage interrupts, DMA requests, and slave port accesses from external modules, the WUGEN_DSP uses several sets of user-programmable registers:

- The WUGEN_MEVT0 through WUGEN_MEVT4 registers define individual mask bits for external asynchronous events (interrupts, DMA requests, and slave port access). This register is read-only, accessible only by the DSP. To modify the value of the individual mask, write 1 to the associated bits of the WUGEN_MEVTCLR0 through WUGEN_MEVTCLR4 registers (to clear) and to the WUGEN_MEVTSET0 through WUGEN_MEVTSET4 registers (to set).
- WUGEN_PENDEVT0 through WUGEN_PENDEVT4 are read-only registers that track which external events are pending in the WUGEN_DSP and are not yet generated to the DSP megamodule INTC or DMA_DSP. If an event is masked, this information is stable until the corresponding mask bit is cleared. If an event is unmasked, this information may not be stable, and therefore corresponds to a transitive period of processing the event in the WUGEN_DSP.

5.3.9.1.1 Event Generation

Figure 5-17 shows event-generation steps in the WUGEN_DSP.

Figure 5-17. DSP WUGEN Event Generation



A An asynchronous event is asserted.

B The event is resynchronized and detected. Because the event is not masked, it is propagated to the DSP megamodule or DMA_DSP.

C The event-pending flag is cleared because the event was generated. The event to the DSP megamodule or DMA_DSP is deasserted after one WUGEN_DSP clock cycle.

D After a period of time, the source of the event is released (probably because it cleared in the corresponding interrupt status register).

E The release of the event is detected and clears the internal EVT_GENERATED flag for that interrupt.

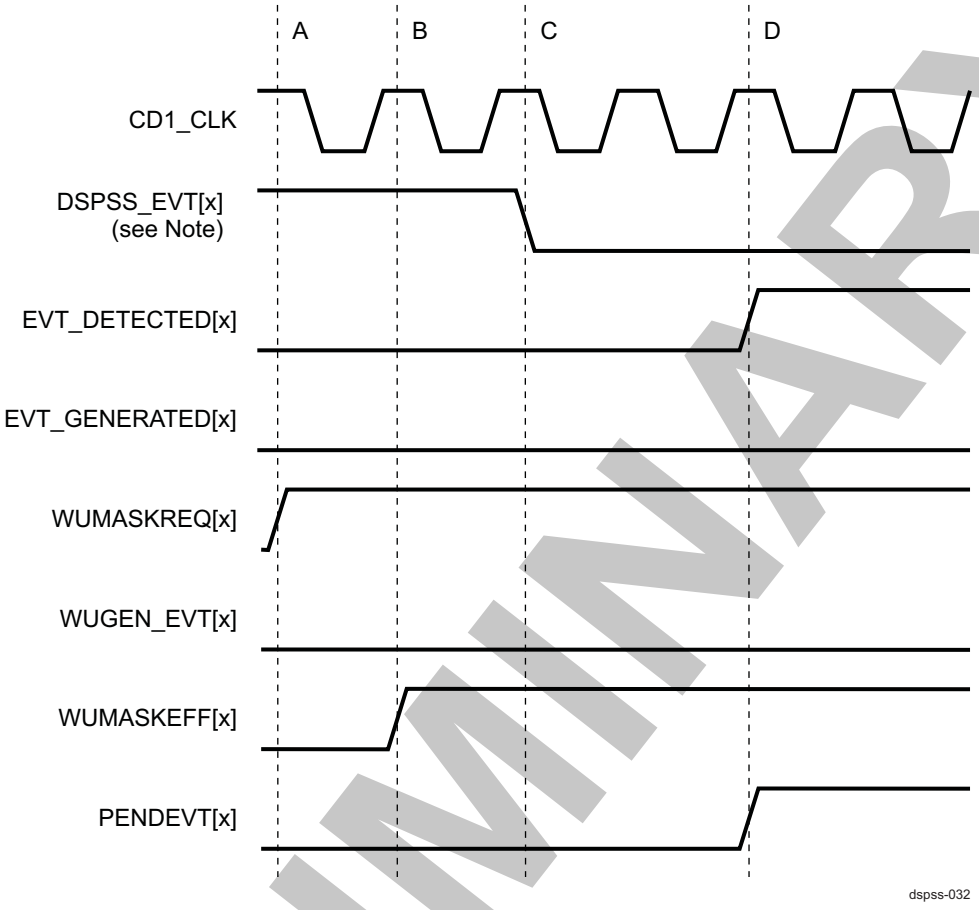
NOTE: DSPSS_EVT[x] refers to DSPSSnIRQ[x] or DSPSS_nDMAREQ[x].

5.3.9.1.2 Individual Event Masking

To mask individual events, write 1 in the WUGEN_MEVTSET0 through WUGEN_MEVTSET4 registers of the WUGEN_DSP. These registers are used to mask interrupts and DMA requests.

Figure 5-18 shows event masking in the WUGEN_DSP.

Figure 5-18. DSP WUGEN Event Masking



A The user sets the corresponding bit in the mask. Event generation is disabled.

B Completion of the event mask is shown in reads of the WUGEN_MEVT0 through WUGEN_MEVT4 registers.

C An asynchronous event is asserted.

D The event is resynchronized and detected. Because the event is masked, it is not propagated to the DSP megamodule or DMA_DSP. The event-pending flag is kept active (sticky) until the mask is removed.

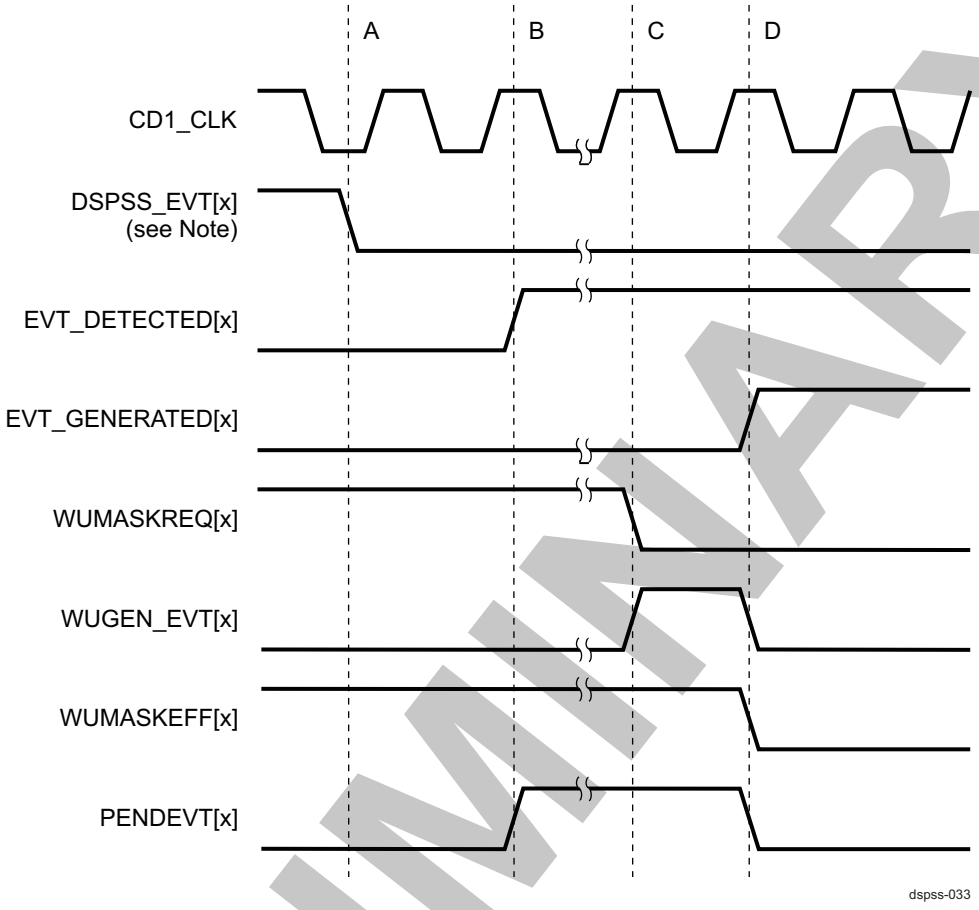
NOTE: DSPSS_EVT[x] refers to DSPSS_nIRQ[x] or DSPSS_nDMAREQ[x].

5.3.9.1.3 Individual Event Mask Clear

To unmask individual events, write 1 in the WUGEN_MEVTCLR0 through WUGEN_MEVTCLR4 registers of the WUGEN_DSP.

Figure 5-19 shows event-mask-clearing in the WUGEN_DSP.

Figure 5-19. DSP WUGEN Event Mask Clear



A An asynchronous event is asserted.

B The event is resynchronized and detected. Because the event is masked, it is not propagated to the DSP megamodule or DMA_DSP. The event-pending flag is kept active (sticky) until the mask is removed.

C After a period of time, clear the corresponding bit in the WUGEN_DSP mask. The event is automatically generated to the DSP megamodule if the event is still seen as active. If the event is not seen as active, nothing happens.

D In both of the previous cases, the event-pending flag is cleared.

NOTE: DSPSS_EVT[x] refers to DSPSS_nIRQ[x] or DSPSS_nDMAREQ[x].

For more information about interrupts and the DMA_DSP programming model, see Section 5.4.4, *Interrupt Management*, and Section 5.4.3.1, *Transfers From/to Device Memories/Peripherals (DMA_DSP)*.

5.3.9.2 Idle Handshake

After reset, the WUGEN_DSP waits for a request. If the user executes the DSP IDLE instruction to put the DSP in STANDBY state, the SYSC initiates a clock-off handshake with the WUGEN_DSP.

5.3.10 SYSC Module

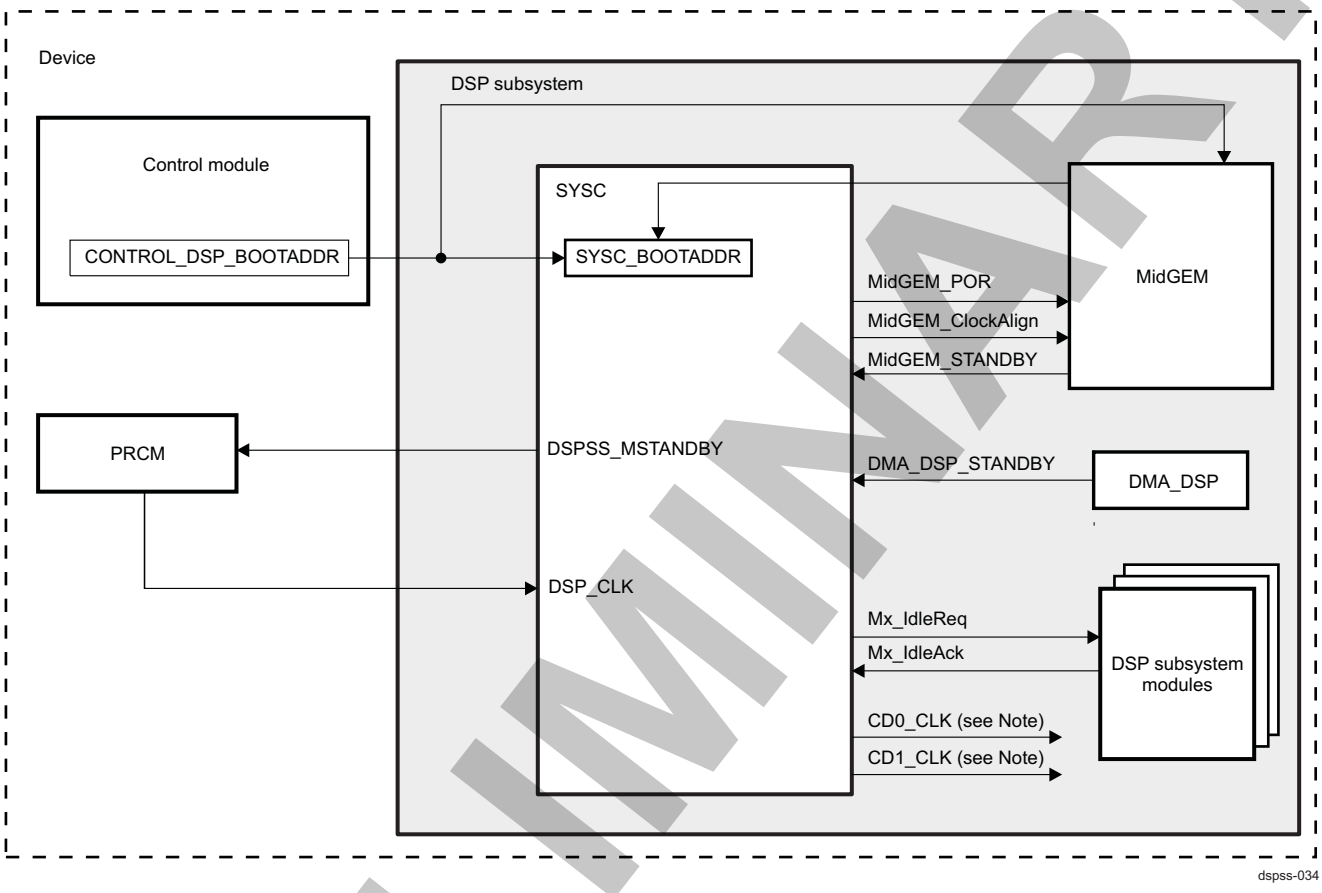
The SYSC module of the DSP subsystem controls the following functions:

- Generation of the divided clocks to all components of the DSP subsystem
- Synchronization of the DSP divided clocks and the DSP megamodule internal-divided clocks
- PRCM module power handshaking
- Sequencing of clock-to-off transition for the DSP modules

- Reset input resynchronization of the active-to-inactive transition to the CD1_CLK clock
- DSP subsystem boot configuration and its access from the DSP

Figure 5-20 is the block diagram of the SYSC in the DSP subsystem.

Figure 5-20. SYSC Block Diagram



NOTE: For more information, see Section 5.3.5, *Clock Configuration*.

5.3.10.1 Divided Clock Generation

The SYSC module generates the divided clocks used by the modules in the DSP subsystem. The SYSC generates the following clocks:

- CD0_CLK
- CD1_CLK

Based on the DSP_FCLK clock, these clocks are configured from the PRCM module. For details, see Section 5.3.5, *Clock Configuration*.

5.3.10.2 Clock Management, Power Down, and Wakeup

The SYSC ensures correct generation of the clocks described in Figure 5-20. The SYSC also allows management of the clock gating of the DMA_DSP and DSP megamodule if the user wants to lead some dynamic power aspects.

The SYSC controls the transition to the DSP subsystem STANDBY state and standby signal generation (the DSPSS_MSTANDBY signal in Figure 5-20) to the PRCM module. Using the signals DSP_MEGACELL_STANDBY, DMA_DSP_STANDBY, Mx_IdleReq, and Mx_IdleAck, the SYSC manages and controls the correct power-down transition of the DSP subsystem and its submodules to ensure that the DSP subsystem internal clocks can be cut. For information about the DSP power-down transition and its programming model, see Section 5.4.6.3, *Power Down and Wakeup Management*.

External events can also occur at the DSP subsystem boundary (access to the DSP subsystem using the slave access port or external nonmasked events), requiring the restart of the DSP subsystem clocks (in case of DSP subsystem STANDBY state). The WUGEN_DSP controls the asynchronous generation of a wake-up signal to the PRCM module; this signal restarts DSP phase-locked loop (PLL) clock generation, allowing the SYSC to regenerate the DSP subsystem internal clocks.

5.3.10.3 Boot Configuration

SYSC_BOOTADDR is the boot-time configuration register. This read-only register is accessible only by the DSP, and its value is determined when the DSP subsystem is released from reset by the PRCM module.

The value of this register is driven externally by the control module register (CTRL_MODULE_CORE.CONTROL_DSP_BOOTADDR), which is read-write accessible by the MPU subsystem for MPU-driven DSP subsystem boot sequence and/or by the DSP for autonomous boot. For more information, see Section 5.4.1, *DSP Boot*.

NOTE: If the values of the CTRL_MODULE_CORE.CONTROL_DSP_BOOTADDR register change, the values of the new SYSC_BOOTADDR register are not updated until the next reset.

For more information, see Section 5.4.1, *DSP Boot*.

5.3.10.4 Interconnect Optimization

SYSC_VBUSM2OCP is a local interconnect configuration register. It is read-write accessible only by the DSP. Setting this register enables or disables interconnect optimization.

5.3.11 Local Memories

The DSP subsystem integrates the following memory controllers under the control of the DSP megamodule:

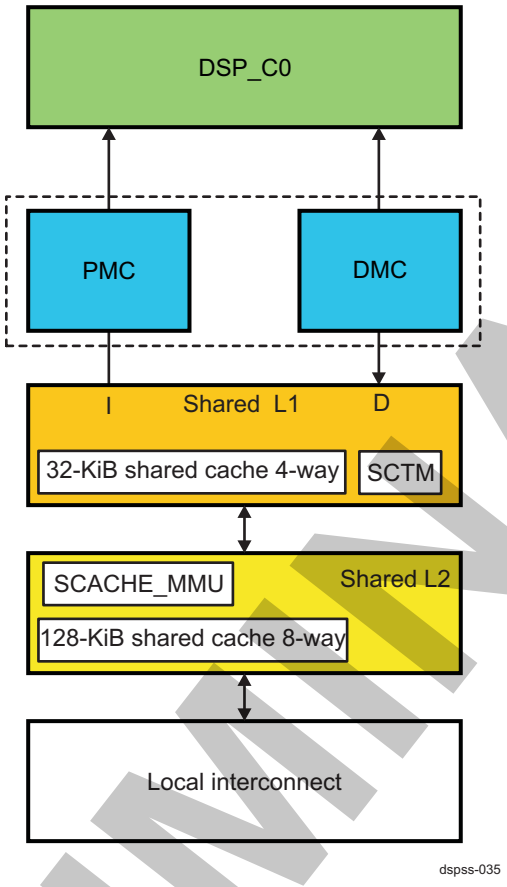
- Data memory controller (DMC)
- Program memory controller (PMC)

Depending on the software configuration of these memory controllers, local memories in the DSP subsystem can be used as cache or memory-mapped memories.

NOTE: When locking, the cache memory acts as if it is a memory-mapped memory. For more information about cache maintenance, see Section 5.4.2.2.3.1, *Maintenance of Caches*.

Figure 5-21 shows the memory hierarchy of the DSP subsystem.

Figure 5-21. DSP Local Memories Hierarchy



5.3.11.1 L1/L2 shared cache Overview

The following features are supported by the shared cache controllers:

- 32-KiB L1 shared cache implemented with high-performance bit cell to run at full-speed
- 128-KiB L2 shared cache implemented with high-density bit cell to optimize area at half-speed
- L1 cache is 32B line size, 4-way set-associative, and organized as 16-bank.
- L2 cache is 32B line size and 8-way set associative.
- L1 cache supports snooping.
- L2 cache slave port to support snooping from DMA_DSP accesses
- Fully pipelined, supports critical-word-first
- Supports write-combining
- Fill and eviction buffers. Supports hit in fill buffer.
- Dynamic sizing, I/D allocation
- Prefetch 4 lines, preload N lines
- Background preload and clean

For information about the software programming model for cache management of the local RAM memories of the DSP subsystem, see Section 5.4.2, *Cache Management*.

5.3.12 SCTM

The SCTM is a generic profile counter and timer module that provides the following functions:

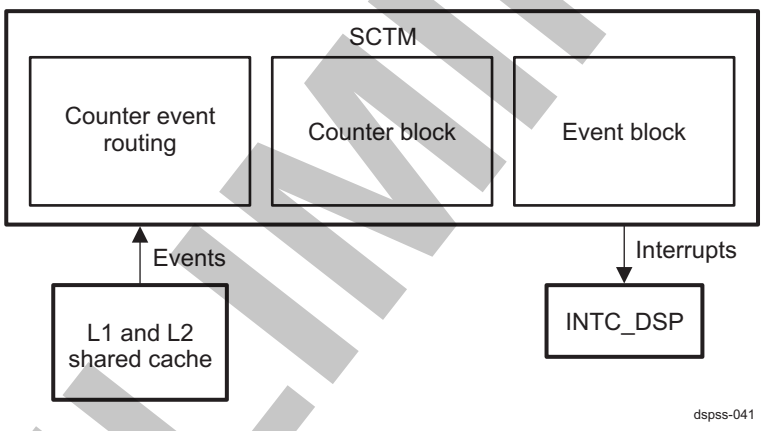
- Counter functions:

  - Input events counting
  - Two counter modes:
    - Event counting
    - Duration counting
  - Counter chaining
- Timer functions:
  - Periodic intervals generation
  - Two timer modes:
    - Run once mode
    - Restart mode
  - Events and/or interrupt generation

The SCTM has eight counters (two of which have timer functions). There are input events going into the SCTM and interrupt events going to the INTC_DSP. For more information about the counter configuration and the SCTM input events, see Section 29.6.3, *DSP Subsystem Performance Monitoring*, in Chapter 29, *On-Chip Debug Support*. For more information about the interrupt event signals, see Section 5.3.7, *Interrupt Requests*.

Figure 5-22 shows the SCTM block diagram.

Figure 5-22. SCACHE SCTM Block Diagram



5.3.12.1 Counter Functions

5.3.12.1.1 Input Events

Signals from within the subsystem are routed to the SCTM and used to control the counters and timers in the module. The routing of the input events from the module boundary to an individual counter is accomplished through an input event multiplexer and is controlled by the SCACHE_SCTM_CTCR_WT_i[20:16] INPSEL and SCACHE_SCTM_CTCR_WOT_j[20:16] INPSEL bit fields.

NOTE: For more information about input events to the module boundary, see Section 29.6.2.2, *Cache Events*, in Chapter 29, *On-Chip Debug Support*.

5.3.12.1.2 Counters

There are individual 32-bit counters in the SCTM. The counters count when the input event signals are asserted.

5.3.12.1.2.1 Counting Modes

The counters in the SCTM support two mutually exclusive counting modes:

- Event mode: The counter increments each time a rising edge is detected on the designated input event signal.
- Duration mode: The counter continually increments when the event input is asserted.

5.3.12.1.2.2 Counter Overflow

When the counter reaches the terminal value (0xFFFFFFF) it wraps and continues to increment. This is considered a timer overflow condition. The SCACHE_SCTM_CTCR_WT_i[6] OVRFLW and SCACHE_SCTM_CTCR_WOT_j[6] OVRFLW bits indicate that overflow has occurred. The overflow bit can be cleared by reading it. When chained, only the high-order counter overflows.

5.3.12.1.2.3 Counters and Processor State

The counters can be configured to alter their behavior based on the state of the CPU. The SCACHE_SCTM_CTCR_WT_i[4] FREE and SCACHE_SCTM_CTCR_WOT_j[4] FREE bits determine whether the counter will continue to operate when the processor enters debug halt state. When the FREE bit is set to 0, the counter stops incrementing while the debug halt input from the CPU is asserted. Normal operation resumes when the processor exits the debug halt state and the debug halt input is deasserted. When the FREE bit is set to 1, the state of the debug halt input is not used to control counter operation.

The SCACHE_SCTM_CTCR_WT_i[5] IDLE and SCACHE_SCTM_CTCR_WOT_j[5] IDLE bits determine whether the counter will continue to operate when the processor enters idle state (the processor is no longer executing instructions and is waiting for a wake-up event). When the IDLE bit is set to 0, the counter stops incrementing while the idle input from the CPU is asserted. Normal operation resumes when the processor exits the idle state and the idle input is deasserted. When the IDLE bit is set to 1, the state of the idle input is not used to control counter operation.

5.3.12.1.2.4 Chaining Counters

The individual 32-bit counters in the SCTM can be chained with an adjacent counter to form a 64-bit counter. Counters chained to a counter across an even-odd index boundary with the even counter contain the least-significant 32 bits of the 64-bit pairing. For example, counters 1 and 0 can be paired and counter 1 will contain bits 63:32 and counter 0 will contain bits 31:0. The high-order counter increments by 1 each time the low-order counter wraps.

Counters are chained by setting the SCACHE_SCTM_CTCR_WT_i[2] CHAIN or SCACHE_SCTM_CTCR_WOT_j[2] CHAIN bit for both counters. When chained, the counter control for both counters is taken from the SCACHE_SCTM_CTCR_WT_i or SCACHE_SCTM_CTCR_WOT_j register of the low-order counter. Other than the CHAIN bit, all other bits in the high-order SCACHE_SCTM_CTCR_WT_i or SCACHE_SCTM_CTCR_WOT_j register are ignored.

Chained counters can function only in counter mode. Timer mode is not supported.

The SCACHE_SCTM_CTCR_WT_i[7] CHNSDW and SCACHE_SCTM_CTCR_WOT_j[7] CHNSDW bits are used to indicate that a counter can provide atomics accessed when chained. These bits are valid only for counters with even indexes (the lower half of a 64-bit counter pair). When these bits are set, the counter can shadow the value of the lower half of the chained counter value at the same time the upper half of the counter is read. The shadowed value (not the current value) is returned when the value of the low-order counter is read. Therefore, when a chained counter has atomic read capability, an atomic counter value can be obtained simply by reading the high-order counter first, followed by the low-order counter. This order must always be observed to prevent reading stale counter values from the low-order counter. When counters are functioning independently, the shadow feature is deactivated and a read of the counter always returns the current value.

5.3.12.1.2.5 Enabling and Disabling Counters

After the counter is correctly configured, it can be started by setting the SCACHE_SCTM_CTCR_WT_i[0] ENBL or SCACHE_SCTM_CTCR_WOT_j[0] ENBL bit. At this point, the counter begins incrementing under the control of the configured event input. The counter can be disabled (counting stops) at any time by clearing the ENBL bit. Counters can be enabled and disabled dynamically during application flow.

Counters can also be enabled and disabled as groups through the SCACHE_SCTM_CTGNBL register. This register provides control of the individual counter-enable in groups. This allows an application to enable or disable groups of counters in lockstep by setting corresponding bits to 1 (bit number corresponds to counter number).

5.3.12.1.2.6 Resetting Counters

The counters can be reset to their initial value (0x00000000) by writing 1 to the SCACHE_SCTM_CTCR_WT_i[1] RESET or SCACHE_SCTM_CTCR_WOT_j[1] RESET bit. If the counter is chained, the high-order and low-order counters are reset when the RESET bit is written for the low-order counter.

Counters can also be reset as groups through the SCACHE_SCTM_CTGRST registers. These registers provide control of the individual counter reset in groups. This allows an application to reset groups of counters in lockstep.

5.3.12.2 Timer Functions

Counters 0 and 1 in the SCTM can function as timers. When operating as timers, interrupts and/or debug input events are generated when the value of the counter reaches a designated interval.

5.3.12.2.1 Periodic Intervals

The interval for a timer is contained in the SCACHE_SCTM_TINTVLR_i register. There is a SCACHE_SCTM_TINTVLR_i register for every timer-capable counter in the SCTM. Timers are initialized to 0. When the corresponding SCACHE_SCTM_CTCNTR_k increments and matches the values designated in SCACHE_SCTM_TINTVLR_i, the timer is considered to be triggered and events configured in SCACHE_SCTM_CTCR_WT_i are generated.

Timers can function in one of two mutually exclusive modes:

- Run-once mode: The timer stops after the first interval match and is not re-enabled until the timer is reset to the initial value (0) by setting the SCACHE_SCTM_CTCR_WT_i[1] RESET bit to 1.
- Restart mode: The timer automatically resets to the initial value (0) each time the designated interval is reached.

The SCACHE_SCTM_CTCR_WT_i[10] RESTART bit is used to configure the timer mode.

5.3.12.2.2 Event Generation

Timers can generate interrupts and debug events. Interrupts are routed from the module boundary to the INTC_DSP in the subsystem. Debug events are routed as triggers to debug logic within the subsystem.

The generation of the interrupts is controlled by the SCACHE_SCTM_CTCR_WT_i[8] INT bit. The generation of debug events is controlled by the SCACHE_SCTM_CTCR_WT_i[9] DBG bit. The INT and DBG bits can be set simultaneously and both signals are generated on interval match.

If neither INT nor DBG is set, the timer function is disabled and the counter functions as a regular counter.

5.3.13 Local Interconnect Network

The local interconnect network - (L2_MAIN_DSP) is the DSP subsystem internal logic that allows internal communication between the modules of the subsystem (for example, the DSP megamodule can communicate with the DMA_DSP or the WUGEN_DSP). Communication with the rest of the system is through the MMU_DSP as master port (accesses from the DSP subsystem to the L3_MAIN interconnect).

The MMU_DSP itself is configured from device MPU via a 32-bit DSPSS slave port on the L4_CFG interconnect.

For information about global memory mapping of the DSP subsystem (DSP_C0 CPU view or MPU view through the L3_MAIN interconnect), see Section 2.2, *L3_MAIN Memory Space Mapping* in Chapter 2, *Memory Mapping*.

5.3.13.1 Endianness

The DSP subsystem local interconnect network does not support the big-endian convention or any type of endianness conversion. Only little endian is supported by the local interconnect network.

5.3.14 Error Reporting

Several mechanisms are available in the DSP subsystem to report errors at different levels.

The interrupt controller of the DSP megamodule allows reporting of dropped interrupts, through the INTERR signal.

L3_MAIN out-of-band errors are reported through the external L3_MAIN interrupt signal. For details about interrupt mapping, see Table 5-6. For information about L3_MAIN interconnect error reporting, see Section 14.2, *L3 Interconnect* in Chapter 14, *Interconnect*.

The DMA_DSP has its own error-reporting mechanism. Error-status registers and error interrupts inform the user of problems during internal operation (data error, bus activity error, etc.) of the DSP subsystem.

For information about error management and the register set that allows error tracing, see Section 5.4.7, *Error Identification Process*.

5.4 DSP Subsystem Programming Guide

5.4.1 DSP Boot

The boot-time configuration register is SYSC_BOOTADDR. This read-only register is accessible only by the DSP_C0 CPU, and its value is determined when the DSP is released from reset, using the CTRL_MODULE_CORE.CONTROL_DSP_BOOTADDR register of the control module (for more information, see Section 18.4.12.1, *DSP Boot Register*, in Chapter 18, *Control Module*). A change to this register is not seen (not sampled) by the DSP subsystem until the next reset.

The DSP normally boots under MPU control, described in Section 5.4.1.2.1, *Boot Under MPU Control*.

A boot under MPU control occurs after the cold reset of the device as a first-time configuration of the DSP subsystem.

5.4.1.1 DSP Boot Configuration

When the DSP subsystem is released from reset, the first fetch address of the C64x equals the address defined in the CTRL_MODULE_CORE.CONTROL_DSP_BOOTADDR[31:10] DSP_BOOT_LOAD_ADDR bit field.

This address can be aligned on any 1-KiB boundary, in ROM, DSP local RAM, or on-chip memory (OCM-RAM), or directly in external memory (for example, SDRAM through the EMIF).

5.4.1.2 Example of DSP Boot

5.4.1.2.1 Boot Under MPU Control

Before waking up the DSP subsystem, the MPU performs the following sequence:

Step 1. The MPU prepares a translation table hierarchy (TTH) in SDRAM at address <TTH Physical Address>. This TTH must contain at least an address translation for the MMU_DSP physical address range.

NOTE: The DSP_C0 CPU does not require an address translation for the TTH, because the TTH is under MPU control only. The DSP_C0 CPU is responsible only for saving and restoring an MMU_DSP context that has been programmed by the MPU.

Step 2. The MPU writes a bootstrap sequence in SDRAM at address <BootLoader Physical Address>. This sequence is executable by the DSP_C0 CPU and contains only relative address references so that it is relocatable without code modification. This sequence must do at least the following:

(a) Set the size of the bootstrap code.

(b) Program the MMU_DSP.

NOTE: At minimum, the bootloader prepares the MMU_DSP for address translation of external accesses. Only from this point can the DSP subsystem work with virtual addresses.

For more information on the MMU_DSP, see Chapter 20, *Memory Management Units*.

Step 3. Program the MMU_DSP.

Step 4. The MPU can lock some other TLB entries, define some power-management MMU_DSP settings, and/or enable some interrupts.

Step 5. The MPU correctly programs the associated L3_MAIN firewall, ensuring that the DSP_C0 CPU has read access to the memory area containing the DSP bootstrap sequence.

Step 6. The MPU programs the associated L3_MAIN firewall, ensuring that the DSP_C0 CPU has read and write access to the configuration registers of the MMU_DSP.

Step 7. The MPU writes <bootloader physical address> to the CTRL_MODULE_CORE.CONTROL_DSP_BOOTADDR[31:10] DSP_BOOT_LOAD_ADDR

bit field.

NOTE: For a detailed description of the system boot register, see Section 18.4.12.1, *DSP Boot Register*, in Chapter 18, *Control Module.*

Step 8. The MPU configures the DSP subsystem clock rate and DSP subsystem-related power-management settings in the PRCM module.

NOTE: Following Step 1 through Step 8, the DSP boot sequence is identical to the autonomous boot sequence. For information about the DSP boot sequence, see Section 5.4.1, *DSP Boot*.

After initialization completes, the MPU allows the DSP to boot:

1. The MPU brings the DSP to the ON state by programming the PRCM module.
2. The MPU sets the clocks back to the DSP subsystem.
3. The MPU releases the DSP from reset.

5.4.2 Cache Management

The DSP subsystem has a 2-level cache-based architecture:

- L1 cache (L1 shared cache) consists of a 32-KiB memory space.
- L2 memory/cache consists of a 128-KiB memory space shared by program and data space. L2 memory can be configured as mapped memory, cache, or a combination of the two.

The virtual address space is split into contiguous chunks to configure which parts of the memory are cacheable and which are not cacheable.

5.4.2.1 Cacheability Settings

This section describes the configuration of cacheability.

The address space of the DSP subsystem is split into contiguous regions of 16 MiB each. Each region has a cacheable attribute that defines whether a reference to a location belonging to the associated memory region must be sent directly to the memory (with exact size and occurrence as requested by the CPU) or must induce a cache line refill and potentially an eviction of another cache line.

The shared cache contains registers that control whether certain ranges of memory are cacheable and whether one or more requestors is allowed access to these ranges.

5.4.2.2 Coherence Maintenance

5.4.2.2.1 Memory-Mapped L1 or L2 Coherence

Coherence is maintained by hardware between L1 cache content and the L2 memory-mapped memory region.

An L2 reference from the DSP_C0 CPU updating an L1 cache location is automatically made visible to the DMA_DSP and any master processor on the device with access to the memory-mapped L2 of the DSP megamodule through the DSP subsystem slave port.

An L2 reference from the DMA_DSP and any other master processor on the device with access to the memory-mapped L2 of the DSP megamodule through the DSP subsystem slave port is automatically made visible to the DSP_C0 CPU through the L1 cache, if it is holding the associated cache line.

5.4.2.2.2 Device Memory Coherence

Coherence is not maintained by hardware between the L2 cache (and L1 cache) and device memories (on-chip memories external to the DSP subsystem and off-chip memories connected to the SDRAM controller and/or general-purpose memory controller [GPMC]). Coherence in this case must be handled by software. The DSP megamodule offers two sets of registers for user-initiated coherence maintenance between DSP local memories and device memories.

Software coherence maintenance must be synchronized in the system (for example, through message passing; for information, see Chapter 19, *Mailbox*). In the producer/consumer model, the producer sends a completion message to the consumer only after the write is complete in end memory. If the producer has a cache-based architecture, the producer must initiate a write-back and track for the completion of the write-back sequence in end memory. When the consumer receives the message, if the consumer has a cache-based architecture, updates by the producer must be seen (not a local nonupdated copy). For a description of how the invalidate sequence occurs in the DSP subsystem, see Section 5.4.2.2.3, *Global Cache Management*.

Two types of cache coherence management are possible:

- Global cache coherence allows the DSP_C0 CPU to ensure coherence of the entire cache at once. See Section 5.4.2.2.3, *Global Cache Management*.
- Block cache coherence allows the DSP_C0 CPU to ensure coherence of a contiguous region of the virtual address map, restricted in size to only what is needed.

Each management type provides three sets of actions:

- Invalidate ensures that all required lines are made invalid in the cache. After that operation, any update (before invalidate operation) in end memory by an alternate processor/DMA_DSP is seen by the DSP_C0 CPU, thus forcing a cache line refill.
- Write-back ensures that all required cache lines modified by the DSP_C0 CPU (also called dirty lines) are written back to end memory so that any local update by the DSP_C0 CPU is made visible by an alternate processor / DMA_DSP. This applies to L1 and L2 caches.
- Write-back and invalidate ensure that all required cache lines modified by the DSP_C0 CPU are written back to end memory so that any local update by the DSP_C0 CPU is made visible by an alternate processor / DMA_DSP; they also ensure that all required lines are made invalid in the cache. After that operation, any update in end memory by an alternate processor / DMA_DSP is seen by the DSP_C0 CPU, thus forcing a cache line refill. This applies to L1 and L2 caches.

5.4.2.2.3 Global Cache Management

This section describes how to invalidate and write-back cache memory.

Maintenance is provided using the SCACHE_MMU_DSP. In addition, the L1 and L2 caches have independent start and end regions that are not limited by the size of the SCACHE_MMU_DSP entries.

Either SCACHE_MMU_DSP maintenance or cache maintenance can be used. However, only one maintenance operation at a time occurs. Direct cache maintenance also provides interrupts when complete.

Unlike SCACHE_MMU_DSP maintenance, direct cache (i.e. L1_SCACHE / L2_SCACHE controllers supported) maintenance locks only the lines already allocated in the cache, and not as needed during allocation.

5.4.2.2.3.1 Direct Maintenance of Caches

Shared cache allows basic maintenance operations, which are performed through a dedicated interface:

1. Preload
2. Lock
3. Clean
4. Invalidate

Maintenance of the cache is performed between the start and end addresses. This allows for direct control of the memory regions. All maintenance operations occur in the background and can generate an interrupt when they complete.

Cache maintenance is controlled by the following registers:

- SCACHE_MTSTART
- SCACHE_MTEND
- SCACHE_INT

- SCACHE_MAINT

Example of global maintenance operation:

1. Configure the start address for cache maintenance by writing the SCACHE_MTSTART register.
2. Configure the end address for cache maintenance by writing the SCACHE_MTEND register.
3. (optional) Activate interrupt generation by writing 0x1 to the SCACHE_MAINT[5] INTERRUPT bit.
4. Select the maintenance type by writing to the SCACHE_MAINT[4:0] bit field (according to the selected maintenance).
5. Wait for the SCACHE_INT[2] MAINT bit to be set to 0 (maintenance is done).

NOTE: Hardware ensures that the maintenance operations are done first in L1, and then in L2.

5.4.2.2.3.2 Attribute MMU Maintenance

The attribute MMU - SCACHE_MMU_DSP provides maintenance control for the DSP_C0 cpu and MPORT. This can be done by setting the SCACHE_MMU_DSP small pages, or alternatively by setting the region for maintenance.

This is done to ensure that the caches can be maintained automatically across cache boundaries. For all maintenance operations, the L1 caches are updated before the L2 caches. This ensures that evictions from L1 are complete before any L2 maintenance.

If there are cache misses during maintenance clean/invalidate, they are considered noncacheable misses until the operation completes. However, hits function normally.

Individual caches can also be maintained separately using start and end addresses instead of pages. However, using SCACHE_MMU_DSP page maintenance has the benefit that the serialization is automatic. Also, the preload/lock feature is automatic during cache misses if the SCACHE_MMU_DSP maintenance is performed.

The basic control functions for maintenance are:

1. Preload
2. Lock
3. Clean (write out dirty lines, but do not invalidate directly)
4. Invalidate

These functions can be used in combination as described in Table 5-7. Either an interrupt or polling of the small page maintenance register indicates whether the maintenance operation is complete.

Only one maintenance operation at a time can be performed, including whether the processor directly accesses the cache maintenance registers. If the user writes a new maintenance operation before the first one completes, the configuration interface stalls.

Table 5-7 shows the combinations and results of setting multiple maintenance functions.

Table 5-7. Maintenance Combinations

Action Combinations	Preload	Lock	Unlock	Clean	Invalidate
Preload	1	0	0	0	0
Lock	0	1	0	0	0
Unlock	0	0	1	0	0
Clean dirty lines	0	0	0	1	0
Invalidate lines only	0	0	0	0	1
Clean -> Invalidate	0	0	0	1	1
Preload -> Lock	1	1	0	0	0
Clean -> Lock	0	1	0	1	0
Bus error	1	x	x	1	x
Bus error	1	x	x	x	1

NOTE:

1. Illegal maintenance combinations (anything not listed in Table 5-7) generate a bus error (response error) on the configuration interface.
2. When a region is set for locking, the pages currently in the cache and any further misses to that region are locked.
3. Locked pages can still be cleaned or invalidated.
4. If all ways of the cache are locked and an allocation cannot occur, no bus error is generated. If a cache is missed when all ways are locked, the data is returned to the CPU, but the line is not allocated in the cache.
5. Queries from MPORT clean and invalidate lines even if they are locked.
6. Once page maintenance begins, the user cannot update the page again until the maintenance is complete.

5.4.2.2.3.2.1 Global Flush

Global flush is controlled by the SCACHE_MMU_MAINT and SCACHE_MMU_MAINTST registers.

Example of global flush:

1. Write 1 to the SCACHE_MMU_MAINT[10] G_FLUSH bit.
2. Wait for the SCACHE_MMU_MAINTST [0] STATUS bit to be set to 0 (maintenance is done).

NOTE: Hardware ensures that the maintenance operations are done first in L1, and then in L2.

5.4.2.2.3.2.2 Maintenance of Caches Through Attribute MMU

Global maintenance is controlled by the SCACHE_MMU_MAINT and SCACHE_MMU_MAINTST registers.

Example of global maintenance:

1. Start cache maintenance by writing 1 to the following registers:
   (a) SCACHE_MMU_MAINT[7] L1_CACHE1 bit to invalidate L1 cache 1
   (b) SCACHE_MMU_MAINT[8] L1_CACHE2 bit to invalidate L1 cache 2
   (c) SCACHE_MMU_MAINT[9] L2_CACHE bit to invalidate L2 cache
2. Wait for the SCACHE_INT[2] MAINT bit to be set to 0 (maintenance is done).

NOTE: Hardware ensures that the maintenance operations are done first in L1, and then in L2.

5.4.2.2.3.2.3 Maintenance of Attribute MMU Pages

SCACHE_MMU_DSP page maintenance is controlled by the following registers:

- SCACHE_MMU_MAINT
- SCACHE_MMU_MTSTART
- SCACHE_MMU_MTEND
- SCACHE_MMU_MAINTST

Example of invalidate:

1. Configure the start address for the cache maintenance by writing the SCACHE_MMU_MTSTART register.
2. Configure the end address for the cache maintenance by writing the SCACHE_MMU_MTEND register.
3. (optional) Activate interrupt by setting the SCACHE_MMU_MAINT[6:5] bit field to 1.
4. Select the maintenance type by setting the SCACHE_MMU_MAINT[4:0] bit field.
5. Wait for the SCACHE_MMU_MAINTST[0] STATUS bit to be set to 0 (maintenance is done).

5.4.3 DSP DMA Management

5.4.3.1 Transfers From/To Device Memories/Peripherals (DMA_DSP)

The DMA_DSP optimizes transfers from/to the DSP megamodule (memory-mapped) memories to/from device on-chip and off-chip memories.

The DMA_DSP can perform transfers from DSP internal memories to DSP internal memories. In this case, use the DMA_DSP with the locked feature.

The DMA_DSP can perform transfers between device memories/peripherals, but it is not designed for that purpose. The DMA_SYSTEM is recommended in that case. For more information, see Section 16.5 , *DMA_SYSTEM Basic Programming Model* in Chapter 16, *Direct Memory Access Controllers*.

5.4.3.2 Programming an DMA_DSP Transfer

Programming a complete DMA_DSP transfer requires the following steps:

Step 1. Define the logical channel(s).

Step 2. Prioritize the defined transfer (with respect to other defined transfers).

Step 3. Start the transfer.

Step 4. Review the progression and completion of the transfer.

5.4.3.3 Defining a Logical Channel

5.4.3.3.1 Single Logical Channel Definition

A complete DMA_DSP transfer can be defined by one or several chained and/or linked logical channels.

Up to 128 independent contexts, each fully defining a logical channel, can be defined. These 128 contexts correspond to the 128 PaRAM entries available in the DSP subsystem. For more information about these PaRAM entries, see Section 5.3.3.1.3, *DMA/QDMA Channel Mapping and PaRAM Entry*, and the corresponding Figure 5-9.

Logical channel definition relies on the following:

- Base addresses:
  - PARAM[LCH#].SRCi: 32-bit source address
  - PARAM[LCH#].DSTi: 32-bit destination address
- Transfer sizes:

  Transfer size is common to source and destination. A transfer can be constituted on a 3D array; C is an array of CCNT arrays, each composed of BCNT arrays, each composed of ACNT bytes:
  - PARAM[LCH#].ACNT: Number of bytes in the A array (from 0 to 65,535)
  - PARAM[LCH#].BCNT: Number of A arrays in the B array (from 0 to 65,535)
  - PARAM[LCH#].CCNT: Number of B arrays in the C array (from 0 to 65,535)

    NOTE: Setting one of the ACNT, BCNT, or CCNT arrays to 0x0 prevents a transfer from being submitted to one of the physical channels (assuming that the compatibility mode is not set; see Kelvin DMA compatibility mode).
  - PARAM[LCH#].BCNTRLD: BCNT reload value when BCNT reaches 0 (from 0 to 65,535)

    NOTE: When programming CCNT>1, it is recommended to program PARAM[LCH#].BCNTRLD to be equal to PARAM[LCH#].BCNT.
- Indexes between dimensions:
  - PARAM[LCH#].SRCBIDX: Index between A arrays at source (from -32,768 to 32,767)
  - PARAM[LCH#].SCRCIDX: Index between B arrays at source (from -32,768 to 32,767)

– PARAM[LCH#].DSTBIDX: Index between A arrays at destination (from -32,768 to 32,767)
– PARAM[LCH#].DSTCIDX: Index between B arrays at destination (from -32,768 to 32,767)

NOTE: Programming the logical channel does not automatically start it. See Section 5.4.3.5.1, *Assigning a Logical Channel to a Trigger Event.*

- Addressing modes:
  – PARAM[LCH#].OPT[0] SAM: Source addressing mode (0: post-incremented; 1: constant)
  – PARAM[LCH#].OPT[1] DAM: Destination addressing mode (0: post-incremented; 1: constant)

NOTE: Constant addressing mode is supported only from/to the DSP megamodule memories, not from/to device memories and peripherals. This can be replaced by using a post-increment addressing mode and an index equal to 0.

Example:

```
/* ------------------------------------------------- */
/* fills dstArray with cstValue values (w/o constant AM) */
/* ------------------------------------------------- */
PARAM[LCH#].SRC = &cstValue;
PARAM[LCH#].DST = &dstArray[0];
PARAM[LCH#].ACNT = sizeof(int);
PARAM[LCH#].BCNT = sizeof(dstArray) / sizeof(int);
PARAM[LCH#].CCNT = 1;
PARAM[LCH#].SRCBIDX = 0;
PARAM[LCH#].DSTBIDX = sizeof(int);
PARAM[LCH#].OPT.SAM = 0;
PARAM[LCH#].OPT.DAM = 0;
```

5.4.3.3.2 Controlling Submission Granularity

The logical channel (when triggered) can split a transfer into several requests submitted to one of the physical channels. The physical channel supports submitted requests of up to two dimensions, meaning that a 3D transfer is always split into (at least) 2D transfers. The user can also program the logical channel so that submitted requests are 1D transfers; for example:

- PARAM[LCH#].SYNCDIM = 0; // submitted transfers are maximum 1D.
- PARAM[LCH#].SYNCDIM = 1; // submitted transfers are maximum 2D.

5.4.3.3.3 Linking to Another Logical Channel

A logical channel can be programmed so that on its completion another context is copied from another logical channel. This is useful because the logical channel is used as a working set during the DMA transfer, meaning that the initial context configuration is lost after the associated transfer completes.

- PARAM[LCH#].LINK = linkLCH# << 5

The LINK value is the base address of the linked logical channel context.

When the LINK value is set to 0xFFFF, no context is loaded for that logical channel:

- PARAM[LCH#].LINK = –1

NOTE: Only the context is copied, and the logical channel is not automatically restarted on link. Restarting a logical channel that just received its new context occurs only when a trigger event associated with that logical channel is detected. See Section 5.4.3.5.1, *Assigning a Logical Channel to a Trigger Event*.

5.4.3.3.4 Chaining Logical Channel

A logical channel can be programmed so that on its total or partial completion, another logical channel is started. This is useful for defining a series of transfers with different contexts as a complete DMA transfer. The main advantage is that the overhead to program all the chained transfers is shared among all channels.

- Partial completion chaining

  After the submitted section (see Section 5.4.3.3.2, *Controlling Submission Granularity*) of a logical channel is complete, a programmable completion code is returned. If partial completion chaining is enabled in the context of the logical channel, this completion code defines which trigger event is set. The logical channel associated with that trigger event is automatically submitted. See Section 5.4.3.5.1, *Assigning a Logical Channel to a Trigger Event*.

  For example, to chain a logical channel LCHi to LCHj so that LCHj is automatically started after each LCHi submission to a physical channel completes:

  – PARAM[LCHi].OPT.TCC = trigEvtx; // trigEvtx: Trigger event number
  – PARAM[LCHi].OPT.ITCCHEN = 1
  – DCHMAP[trigEvtx] = LCHj

- Total completion chaining

  After all submitted parts of a logical channel are complete, the programmable completion code is returned. If total completion chaining is enabled in the context of the logical channel, this completion code defines which trigger event is set. The logical channel associated with that trigger event is automatically submitted. See Section 5.4.3.5.1, *Assigning a Logical Channel to a Trigger Event*.

  For example, to chain a logical channel LCHi to LCHj so that LCHj is automatically started after LCHi completes:

  – PARAM[LCHi].OPT.TCC = trigEvtx; // trigEvtx: Trigger event number
  – PARAM[LCHi].OPT.TCCHEN = 1
  – DCHMAP[trigEvtx] = LCHj

5.4.3.4 Prioritizing Defined Transfers

5.4.3.4.1 Mapping Between DMA/QDMA Events and Event Queues

The assignment of 64 DMA and 8 QDMA channels to two event queues of the channel controller is achieved by configuring the DMA queue number register (TPCC_DMAQNUM_n, where n = 0 to 7) and the QDMA queue number register (TPCC_QDMAQNUM). When an event is selected for submission, it is queued in the user-defined event queue. This typically defines a 2-level priority preemption scheme, because queues are usually mapped to different transfer controllers.

5.4.3.4.2 Mapping a Queue to a Transfer Controller

Events at the head of an event queue define which logical channel (PaRam entry) is selected for submission to the associated physical channel (transfer controller). The association between an event queue and a physical channel can be defined in the TPCC_QUETCMAP register. By default, TPTC0 is associated with event queue 0, and TPTC1 is associated with event queue 1. This mapping is a static decision; it does not change during DMA operation.

NOTE: TPTC0 and TPTC1 are not symmetrical; their numbers are simply inverted, compared to the Davinci device. To improve compatibility with Davinci devices, invert the mapping of the event queue to the transfer controller, as shown in the following:

QUETCMAP = (QUETCMAP &~0xFF) | 0x10;

Typically, this is used to allow submission-time preemption so that by example:

- Event queue 0 is used for background, potentially long, not latency-sensitive, noncritical DMA transfers.
- Event queue 1 is used for short, latency-sensitive, or critical (for example, hardware-synchronized) DMA transfers.

5.4.3.4.3 Handling Priority

In DSP subsystem local interconnect arbitration, the priority of individual bus requests for a DMA transfer over other DMA- or CPU-initiated bus requests is defined by the event queue to which the event associated with the transfer is submitted. This can be configured per event queue in the TPCC_QUEPRI[2:0] PRIQ0 and TPCC_QUEPRI[6:4] PRIQ1 bit fields. By default, event queues 0 and 1 have the same priority (the highest possible priority is 0x0).

Typically, this is used to allow transfer-time preemption so that, for example, bus requests associated with event queue 1 are served before event queue 1 or CPU requests.

Example:

- // DMA#0->0x7 (lowest), DMA#1->0x0 (highest), CPU->0x4 (mid)
- QUEPRI = (QUEPRI &~0xFF) | 0x07;
- MDMAARBE = (QUEPRI &~(0xF16)) | 0x4 16;

5.4.3.4.4 Aged Priority

To prevent DMA requests from being stalled for a long time, the DSP subsystem implements an aged priority scheme (also referred to as an inversion priority scheme) on the DMA_DSP ports to change the priority defined in the TPCC_QUEPRI register. This is done by regularly decreasing the priority level (increasing the priority in arbitration) of a stalled request. The interval between two consecutive updates of the priority level is defined in the SYSC_EDMA register. By default, the aged priority scheme is disabled (SYSC_EDMA = 0x0), and the arbitration priority is dictated by values programmed in TPCC_QUEPRI.

5.4.3.5 Starting the Transfer

Before starting the transfer, a trigger event must be associated with the logical channel. Three modes trigger a DMA transfer:

- Manual (software-synchronized transfers)
- Hardware (hardware-synchronized transfers)
- Automatic (automatic on-submission transfer start)

5.4.3.5.1 Assigning a Logical Channel to a Trigger Event

The 64 DMA channels and the 8 QDMA channels can be flexibly mapped to any of the 128 available PaRAM entries (see Figure 5-9).

Any of the 64 DMA channels can be mapped to any of the 128 PaRAM entries through the DMA channel-mapping registers TPCC_DCHMAPN_i (where i = 0 to 63).

Any of the 8 QDMA channels can be mapped to any of the 128 PaRAM entries through the QDMA channel-mapping registers TPCC_QCHMAPN_j (where j = 0 to 7).

5.4.3.5.2 Manual Trigger (Software-Synchronized Transfers)

When a logical channel is defined and prioritized, the user can assign the logical channel (or the first in the chained list) to a trigger event (from 0 to 63) by writing the number of the logical channel (PaRAMEntry #) to one of the DMA channel-mapping registers (TPCC_DCHMAPN_i, where i = 0 to 63). Then, the user can manually start the transfer (one logical channel or a chained list of logical channels) by writing 1 to the bit in the TPCC_ESR or TPCC_ESRH register associated with the trigger event of the logical channel (or the first logical channel in the chained list).

NOTE: The event does not have to be enabled in the TPCC_EER register to be manually triggered.

Example:

```
/* ------------------------------------------- */
/* To manually start defined logical channel #0x3, uses event #20 */
/* ------------------------------------------- */
DCHMAP[20] = (DCHMAP[20] & ~(0x1FF<<5)) | 0x3<<5;ESR = 1 << 20;
```

5.4.3.5.3 Hardware Trigger (Hardware-Synchronized Transfers)

When a logical channel is defined and prioritized, the user can assign the logical channel (or the first in the chained list) to a trigger event (from 0 to 19) by writing the number of the logical channel (PaRAMEntry #) to one of the DMA channel-mapping registers (TPCC_DCHMAPN_i, where i = 0 to 19). The user can allow this logical channel to be triggered by an associated hardware DMA request by writing 1 in the associated bit of the EER register. The mapping of a hardware DMA request to DMA events is fixed. The mapping of DMA requests to device peripheral sources is listed in Table 5-3.

Example:

```
/* ---------------------------------------------------- */
/* Associate defined logical channel #0x5 to UART3_DMA_TX */
/* UART3_DMA_TX is DMA request #10 and associated to evt #10 */
/* ---------------------------------------------------- */
DCHMAP[10] = (DCHMAP[10] & ~(0x1FF<<5)) | 0x5<<5;
```

5.4.3.5.4 Automatic Trigger (QDMA)

The user can specify a trigger word from any of the eight 32-bit words of the logical channel context (PaRAM entry) for QDMA. Writing to the trigger word triggers the channel controller of QDMA to issue a transfer request. The trigger word field of the QDMA channel mapping register TPCC_QCHMAPN_j (where j = 0 to 7) defines the trigger word for a particular QDMA channel, as shown in Figure 5-9.

This flexibility enables the CPU to selectively modify only the PaRAM entry that requires modification and thereby trigger the transfer. For example, after a transfer, if only the count must change, QCHMAP can be configured so that count is the trigger word, and a write to it automatically triggers the transfer.

Example:

```
/* ------------------------------------------------ */
/* Associate defined logical channel #0x5 to QDMA #1 */
/* ------------------------------------------------ */
QCHMAP[1] = (QCHMAP[1] & ~(0x1FF<<5)) | 0x5<<5;
/* ------------------------------------------------ */
/* Define DST parameter (0x3) to be trigger word of LCH */
/* ------------------------------------------------ */
QCHMAP[1] = (QCHMAP[1] & ~( 0x7<<2)) | 0x3<<2;
```

5.4.3.5.5 Direct Configuration to Transfer Channel (Not Recommended)

The registers of the physical channels are memory-mapped primarily to enable, clear, and read status for error interrupts generated by the physical channel. For more information, see Section 5.4.7, *Error Identification Process*.

It is possible to write directly to other control registers of the physical channels and to issue a transfer; however, this is not recommended and therefore is not described here.

CAUTION

This can work safely only if the DMA_DSP controller is not used.

5.4.3.5.6 DSP DMA Completion Mode

The DSP DMA defines when a DMA transfer is complete:

- Early completion: All associated transfers were submitted to the physical channel. Early completion does not ensure that the transfer is complete in end memory.
  - PARAM[LCHi].OPT.TCCMODE = 1
- True completion: All associated transfers were submitted to the physical channel and all are complete from the physical channel standpoint. True completion ensures that the transfer is complete in end memory.
  - SYSC_VBUSM2OCP.DMATRUECOMPEN = 1; // is statically set.
  - PARAM[LCHi].OPT.TCCMODE = 0

NOTE: TCCMODE = 0 does not ensure that the transfer is complete in end memory if DMATRUECOMPEN = 0.

By default, DMATRUECOMPEN = 0. This is recommended to statically set DMATRUECOMPEN.

True completion is typically used when the DMA_DSP is the producer of a buffer shared with another master processor or a DMA (consumer). A completion message is sent to the consumer only after the DMA transfer is complete.

Completion mode affects the timing for the following actions:

- IPR/IPRH bit update (for polling scheme)
- Interrupt generation (for interrupt scheme)
- CER/CERH bit update (for chaining)

5.4.3.5.7 Partial Versus Total Completion

DMA_DSP can be programmed so that the IPR bit update and interrupt generation occur:

- After each submission to the physical channel is complete
- After the last submission to the physical channel is complete

Partial completion interrupt

After the submitted section (see Section 5.4.3.3.2, *Controlling Submission Granularity*) of a logical channel is complete, a programmable completion code is returned. If a partial completion interrupt is enabled in the context of the logical channel, this completion code defines which IPR bit is set.

For example, to allow IPR to be updated (and possibly an interrupt to be generated) after each LCHi submission to a physical channel is complete:

- PARAM[LCHi].OPT.TCC = intEvtx; // intEvtx: IPR bit to be updated
- PARAM[LCHi].OPT.ITCINTEN = 1

Total completion interrupt

After all submitted parts of a logical channel are complete, a programmable completion code is returned. If a total completion interrupt is enabled in the context of the logical channel, this completion code defines which IPR bit is set.

For example, to allow IPR to be updated (and possibly an interrupt to be generated) after all LCHi submissions to a physical channel are complete:

- PARAM[LCHi].OPT.TCC = intEvtx; // intEvtx: IPR bit to be updated
- PARAM[LCHi].OPT.TCINTEN = 1

– By polling
– By interrupt

5.4.3.5.8 Tracking DMA Completion

There are two ways to track DMA completion:

- Polling the completion register when the estimated completion time has elapsed
- Enabling completion interrupts

Polling example (total completion)

- PARAM[myLCH].OPT.TCINTEN = 1; // total interrupt completion bit update
- PARAM[myLCH].OPT.ITCINTEN = 0; // no partial interrupt completion bit update
- PARAM[myLCH].OPT.TCC = myTCC
- // myTCC does not contribute to interrupt generation (polling mode)
- IER = (IER &~(1<<myTCC)) | 0<<myTCC
- // start transfer
- DCHMAP[myEvt] = (DCHMAP[myEvt] &~(0x1FF<<5)) | myLCH<<5
- ESR = 1 << myEvt
- // do something useful (that does not depend on DMA completion)
- // poll IPR bit
- while(!(IPR & (1<<myTCC))); // polls for completion

Interrupt example (total completion)

- disable_interrupts()
- PARAM[myLCH].OPT.TCINTEN = 1; // total interrupt completion bit update
- PARAM[myLCH].OPT.ITCINTEN = 0; // no partial interrupt completion bit update
- PARAM[myLCH].OPT.TCC = myTCC
- // myTCC does contribute to interrupt generation (polling mode)
- IER = (IER &~(1<<myTCC)) | 1<<myTCC
- INTMUX[0] = (INTMUX[0] &~(0x7F)) | 0x1D; // map CPU it #4
- CPU.IER = (CPU.IER & (1<<4)) | 1<<4; // unmask CPU it #4
- enable_interrupts()
- // start transfer
- DCHMAP[myEvt] = (DCHMAP[myEvt] &~(0x1FF<<5)) | myLCH<<5
- ESR = 1 << myEvt
- // do something useful (that does not depend on DMA completion)
- // this code is interrupted when DMA completes

5.4.3.5.9 DMA Interrupt Service Routine

The channel controller does not generate a new interrupt signal for new pending interrupts if the user did not clear previous pending interrupts. There are two options for constructing an interrupt service routine (ISR) for DMA. The first option is to poll all the bits during execution of the ISR and clear all enabled bits in an interrupt-pending register by writing to the interrupt-pending clear (ICR/ICRH) register before exiting any ISR. The pseudo-code for this option is:

Step 1. Enter ISR.
Step 2. Read TPCC_IPR.
Step 3. For the condition set in TPCC_IPR:
(a) Perform operation as needed.
(b) Clear bit for serviced INT.

Step 4. Read IPR:

(a) If TPCC_IPR = 0, exit ISR.

(b) If TPCC_IPR = 1, return to Step 3.

The second option is to service the ISR, and then before exiting the ISR, write to the EVAL bit of the IEVAL register. This forces the DMA_DSP channel controller to generate a new interrupt signal, if there are interrupts in the interrupt-pending register (IPR/IPRH). The pseudo-code for this ISR option is:

Step 1. Enter ISR.

Step 2. Read TPCC_IPR.

Step 3. For the condition set in TPCC_IPR:

(a) Perform operation as needed.

(b) Clear bit for serviced INT.

Step 4. Read IPR:

(a) If TPCC_IPR= 0, exit ISR.

(b) If TPCC_IPR= 1, set the TPCC_IEVAL.EVAL bit to force triggering a new interrupt.

5.4.3.5.10 Benchmarking

The DMA channel controller monitors the number of event entries in an event queue to determine whether they exceed the user-programmed threshold. The queue threshold for each event queue can be programmed in the TPCC_QWMTHRA and TPCC_QWMTHRB registers. When the number of event entries in an event queue exceeds the user-programmed threshold, a queue threshold error occurs. This error is captured in the THRXCD bit field of event-queue status register TPCC_QSTATN_i (where i = 0 or 1) and in the TPCC_CCERR QTHRXCDn bit field.

5.4.3.5.11 Kelvin DMA Compatibility Mode

Any channel can be configured to keep compatibility with Kelvin DMA settings. To do this, the user must set the TPCC_OPT_m[19] WIMODE bit. It is recommended to always clear this bit, except when reusing existing Kelvin code.

- PARAM[LCH#].OPT.WIMODE = 0

NOTE: If reusing existing Kelvin code, see the *eDMA Migration Guide for DM420*.

5.4.4 Interrupt Management

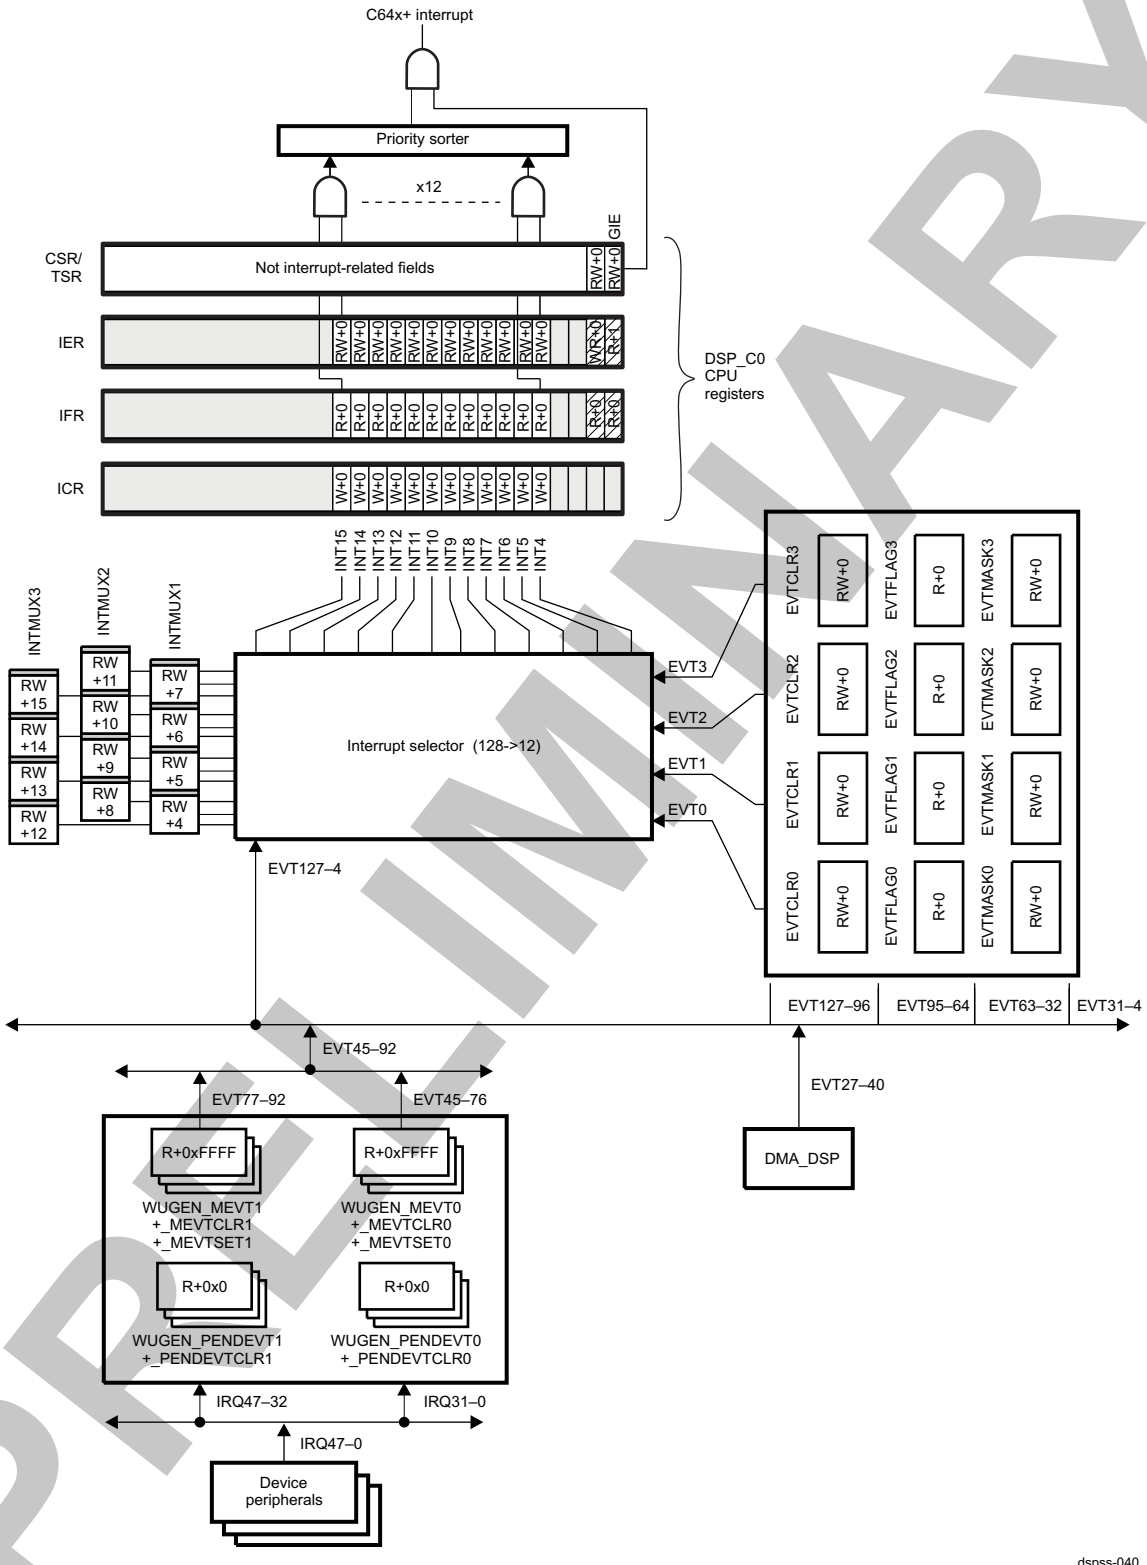
5.4.4.1 Interrupt Flow in DSP Subsystem

The DSP megamodule INTC_DSP detects, combines, and routes up to 128 system events (internal and external) to the 12 DSP_C0 CPU interrupt lines. For more information about interrupt mapping of the DSP subsystem (internal and external interrupts), see Table 5-6.

The WUGEN_DSP generator of the DSP megamodule internally routes the interrupt request to the IC module.

Figure 5-23 shows the interrupt flow of the DSP subsystem with the main wake-up generator and IC registers used for event generation.

Figure 5-23. DSP Subsystem Interrupt Flow



NOTE: The CSR/TCR, IER, IFR, and ICR registers belong to the DSP_C0 CPU block (C64x+). For more information, see the C64x+ documents listed in Section 5.3.2.7, *Other DSP Reference Documents*.

5.4.4.2 Event Combined Programming Sequence

In addition to generating a combined interrupt based on programmable event combinations, the event combiner provides a masked view of the event flag registers. By reading the masked event flag registers (SYS_INTC_MEVTFLAGi, where i = 0 to 3), the DSP_C0 CPU sees only the event flags pertaining to the corresponding combined event (EVTx, where x = 0 to 3).

When servicing a combined interrupt, perform the following steps:

Step 1. Read the SYS_INTC_MEVTFLAGi register corresponding to the combined event EVTx.

Step 2. Check the pending events.

Step 3. Write the value of the SYS_INTC_MEVTFLAGi register into the SYS_INTC_EVTCLRi register (where i = 0 to 3).

Step 4. Service the received interrupts.

Step 5. Repeat Step 1 through Step 4 until SYS_INTC_MEVTFLAGi = 0x0.

This clears only those events combined on EVTx. Events masked in the SYS_INTC_EVTMASKi register (where i = 0 to 3) do not need to be cleared if they are set in the SYS_INTC_EVTFLAGi register (where i = 0 to 3) (they can generate an exception or are used as event outputs).

Before returning, the DSP_C0 CPU must repeat Step 1 through Step 4 until no pending events are found. This ensures that events received during the ISR are captured. If an event EVTx is received at the same time that its flag is being cleared in the SYS_INTC_EVTCLRi register, it does not clear. Repeating Step 1 through Step 4 ensures that no events are missed.

5.4.4.3 Event <-> Interrupt Mapping Programming Sequence

The INTC_DSP allows programming independently which of the 128 input events is mapped to each DSP_C0 CPU interrupt; this is done by writing the event number in the bit field that corresponds to the CPU interrupt in the SYS_INTC_INTMUXj register (where j = 1 to 3).

Example:

```
/* ------------------------------------------------- */
/* evtTable has the 12 evt <-> CPU interrupt mapping */
/* ------------------------------------------------- */
evtTable[0] = 55;
// Mailbox event highest priorityevtTable[1] = 61;
// MCBSP1TX event[...]evtTable[11] = 29;
// DMA_DSP 3 gbl completion event lowest priorityfor(I=0; i<12; I++)
// for each CPU maskeable interrupt{
INTMUX(I >> 2 + 1) |= (evtTable[i] & 0x7F) << ((I & 0x3) << 3);}
```

5.4.4.4 Interrupt Exception Programming Sequence

The INTC_DSP can generate a system event (INTERR) that is internally routed to system event input EVT96. This event is generated when a DSP_C0 CPU interrupt is dropped (a DSP_C0 CPU interrupt is received while the interrupt flag is already set in the DSP_C0 CPU).

This can inform the user of possible problems in the software code, such as whether interrupts were disabled for an extended period of time, or whether pipelined (noninterruptible) code sections were too long.

NOTE: Because the interrupt drop detection logic is in the CPU, only interrupts sourced from a single system event can be detected. The dropping of individual combined events is not possible, although dropping the output of an event combiner is possible. Only the first dropped interrupt detected is reported by the INTERR event.

The SYS_INTC_INTXSTAT register holds the ID of the CPU interrupt and the system event number of the dropped event. By setting the SYS_INTC_INTXCLR[0] CLEAR bit to 1, the software user resets the SYS_INTC_INTXSTAT register to 0.

When servicing the interrupt exception, the CPU performs three steps:

1. Reads the SYS_INTC_INTXSTAT register
2. Checks the error condition
3. Clears the error through the SYS_INTC_INTXCLR register

The dropped events that generate the INTERR event (EVT96) can be qualified by a mask register. CPU interrupts that are to be ignored by the drop detection hardware can be masked in the SYS_INTC_INTDMASK register.

5.4.4.5 INTC Basic Programming Model for Low-Power State of DSP Subsystem

To run the procedure for a correct transition to power-down state not involving logic-off, the user must perform the following procedure:

1. Ensure that all wake-up events are correctly mapped to enabled DSP_C0 CPU interrupts and are unmasked in combined event registers (if combined events are used).
2. Clear the associated bits in the WUGEN_MEVT0 and WUGEN_MEVT1 registers to unmask wake-up interrupts.

NOTE: Software must not unmask an event in the WUGEN_DSP that is not correctly mapped to an enabled DSP_C0 CPU interrupt. If that event is triggered, the DSP subsystem exits the power-down state but does not wake up.

5.4.4.6 INTC Basic Programming Model for Power On of DSP Subsystem

Programming model at boot time:

There is no specific software setting required to use combined/noncombined events during normal operation. However, at boot time, the event can be captured in the event-combiner event flag and not be propagated to the DSP. To do this, the following procedure must be performed:

1. The DSP subsystem logic ensures that interrupts are presented to the DSP megamodule only after:
   (a) The DSP megamodule module has its clock.
   (b) The DSP megamodule module is reset correctly.
2. From the time the pre-idle sequence is started to the time when the DSP subsystem context is fully restored and operational after wakeup, it is assumed that only external (from device peripherals) interrupts can occur. Internal interrupts in the DSP megamodule can result only from an application software side effect; the application is stopped when entering the pre-idle sequence and is restarted only after the DSP subsystem context is fully restored and operational. DMA interrupts are inactive at this stage, because the DMA_DSP module is completely reset after power up, and a software action is required to reactivate the DMA_DSP interrupts.
3. All device peripheral interrupts are level and are kept asserted until software acknowledges the interrupt by writing 1 to the interrupt status register (DSP_C0 CPU ISR) bit corresponding to the enabled asserted event(s). The device peripheral must keep an event flag to track missed interrupts. For a complete description of the DSP_C0 CPU ISR, see the C64x+ documents listed in Section 5.3.2.7, *Other DSP Reference Documents*.
4. There is no specific requirement to configure or restore interrupt mapping, except having the interrupts globally disabled during the sequence:
   (a) Set the DSP_C0 CPU TSR[0] or CSR[0] GIE bit to 0 to disable all interrupts except the reset interrupt and nonmaskable interrupt (NMI). The GIE bit is the same physical bit in the TSR and CSR. For a complete description of these registers, see the C64x + documents listed in Section 5.3.2.7, *Other DSP Reference Documents*.
   (b) Remap interrupts by configuring the SYS_INTC_INTMUXj registers (where j = 1 to 3).
   (c) Set the DSP_C0 CPU TSR[0] or CSR[0] GIE bit to 1 to enable all DSP_C0 CPU interrupts.

The DSP_C0 CPU software recognizes which degree of power state the C64x reaches when executing the IDLE instruction, because the PRCM module is under C64x software control. Therefore, the DSP_C0 CPU software can correctly skip some unnecessary parts of the pre-idle routine.

State after reset for DSP_C0 CPU and INTC_DSP registers:

- The value of DSP_C0 CPU IER is 0x0.
- The value of DSP_C0 CPU IFR is 0x0 because the interrupt selector default mapping is routing only emulation and unmapped events.
- The SYS_INTC_INTMUXj registers (where j = 1 to 3): The default mapping is to route EVTx (where x = 0 to 3) on INTy (where y = 4 .. 15) (emulation and nonmapped events).
- The value of the SYS_INTC_EVTMASKi registers (where i = 0 to 3) is 0x0 (all events are unmasked). The values of these registers are don't care because of the default interrupt selector mapping (the SYS_INTC_INTMUXj registers (where j = 1 to 3).
- The SYS_INTC_EVTFLAGi registers (where i = 0 to 3): These registers log the possible wake-up interrupt(s) (if more than one). At this stage, a new wake-up interrupt from device peripherals cannot be missed, because interrupts are level in the device, waiting for a software acknowledge (the user must clear the interrupt in the module to deassert the interrupt line).

For a complete description of the DSP_C0 CPU IER and IFR, see the C64x+ documents listed in Section 5.3.2.7, *Other DSP Reference Documents*.

State after reset for the WUGEN_DSP registers (two cases depending on the reset type):

- In case of cold POR (the CORE power domain has been powered off), the value of the WUGEN_MEVT0 register is 0xFFFF FFFF, and the value of the WUGEN_MEVT1 register is 0xFFFF, meaning that all interrupts are masked.
- In case of warm POR (the CORE power domain was in ACTIVE state), the value of the WUGEN_MEVT0 and WUGEN_MEVT1 registers is the previous programmed one, enabling only wake-up interrupts.

Programming model for a correct warm-reset:

The user must replay the noncombined events required for wakeup (if any):

1. Globally mask interrupts by setting the DSP_C0 CPU TSR[0] or CSR[0] GIE bit to 0 (already done at boot time).
2. Restore the interrupt selector configuration:
   (a) SYS_INTC_INTMUXj register (where j = 1 to 3)
   (b) SYS_INTC_EVTMASKi register (optional, where i = 0 to 3)
   (c) SYS_INTC_INTDMASK register (optional)
3. Replay the noncombined event captured in SYS_INTC_EVTFLAGi (where i = 0 to 3):
   For each DSP_C0 CPU interrupt, i = 4 to 15:
   (a) Grab mapped event by setting the SYS_INTC_INTMUXj[6:0] INTSELi bit field (where j = 1 to 3).
   (b) Check whether the event is combined (EVT0...3) or not combined (EVT4...127).
   (c) If combined, exit the loop and go to the next loop iteration.
   (d) If noncombined:
      (i) Check whether the event is pending in the SYS_INTC_EVTFLAGi EFy bit (where i = 0 to 3, and y = 0 to 127).
      (ii) If not pending, exit the loop and go to the next loop iteration.
      (iii) If pending, set the associated IFi bit in the DSP_C0 CPU IFR.

NOTE: Software must ensure that an event is enabled only once in the interrupt selector/combiner of the DSP megamodule. If a noncombined event is mapped to an enabled DSP_C0 CPU interrupt, the associated combined event is masked in the associated SYS_INTC_EVTMASKi register (where i = 0 to 3) (and/or the combined event is not mapped to the DSP_C0 CPU interrupt). Reciprocally, if a combined event is mapped to a DSP_C0 CPU interrupt, all unmasked events in the associated SYS_INTC_EVTMASKi register (where i = 0 to 3) are not mapped as noncombined events to an enabled DSP_C0 CPU interrupt (through the DSP_C0 CPU IER).

Software program example for Step 3:

```
/* ---------------------------------------------------- */
/* Replays IFR bits associated to noncombined events */
/* Assumes interrupts globally disabled (GIE bit set to 0)*/
/* Assumes SYS_INTC.INTMUXj() and SYS_INTC.EVTFLAGi() are */
/* access macros to DSP megamodule IC registers */
/* ---------------------------------------------------- */
myIPR = IPR; // save IPRfor(I=0; i<12; I++)
// for each CPU maskable interrupt{
myEvt = ( INTMUX( I >> 2 + 1) >> ( (I & 0x3) << 3 ) ) & 0x7F;
if(myEvt >= 4)
// noncombined event
{
if( (EVTFLAG(myEvt >> 5 ) >> (myEvt & 0x1F ) ) & 0x1 )
{
myIPR |= (1<<(I+4));
}
}}
IPR=myIPR;
// update IPR register
/* ---------------------------------------------------- */
/* Interrupts can be globally re-enabled from that point */
/* ---------------------------------------------------- */
```

4. Restore the CPU interrupt configuration by setting the DSP_C0 CPU IER accordingly.
5. Restore the DSP subsystem context (except saved return-PC).
6. Globally enable the interrupts by setting the DSP_C0 CPU TSR[0] or CSR[0] GIE bit to 1.
7. Branch to saved return-PC.

For a complete description of the DSP_C0 CPU TSR, CSR, IER, or IFR, see the C64x+ documents listed in Section 5.3.2.7, *Other DSP Reference Documents*.

Procedure for a cold reset:

1. Globally mask interrupts by setting the DSP_C0 CPU TSR[0] or CSR[0] GIE bit to 0 (already done at boot time).
2. Restore the interrupt selector configuration:
   (a) SYS_INTC_INTMUXj register (where j = 1 to 3)
   (b) SYS_INTC_EVTMASKi register (optional, where i = 0 to 3)
   (c) SYS_INTC_INTDMASK register (optional)
3. It is unnecessary to replay events, because they are masked in the WUGEN_MEVT0 and WUGEN_MEVT1 registers (default WUGEN_DSP configuration). This can be done to simplify the boot sequence without discriminating between cold reset and warm reset.
4. Restore the CPU interrupt configuration by setting the DSP_C0 CPU IER accordingly.
5. Restore the WUGEN_DSP context. This can be forced even in warm reset to simplify the boot sequence without discriminating between cold reset and warm reset.

NOTE: If Step 3 and Step 5 are performed systematically, the boot code can be shared between warm reset and cold reset boot without programming two distinct software boot codes.

6. Restore the rest of the DSP subsystem context (except saved return-PC).

7. Globally enable the interrupts by setting the DSP_C0 CPU TSR[0] or CSR[0] GIE bit to 1.
8. Branch to saved return-PC.

5.4.5 Memory Management

5.4.5.1 External Memory

5.4.5.1.1 Cacheability

The SCACHE_CONFIG and SCACHE_OCP registers are used to configure the caches.

5.4.5.1.2 Virtual Addressing

The device embeds an instance of MMU dedicated to the DSP (MMU_DSP). For more information about MMU_DSP software settings at DSP boot, see Section 5.4.1.2, *Example of DSP Boot*.

For a programming guide of the MMU_DSP, see Chapter 20, *Memory Management Units*.

5.4.6 DSP Power Management

5.4.6.1 Clock Management

5.4.6.1.1 Clock Configuration

The DSP subsystem receives one single-clock signal (DSP_CLK) from the PRCM module.

From the DSP_GCLK functional clock, internal clocks (CD0_CLK and CD1_CLK) are generated by the DPLL_IVA and SYSC.

For a complete description of the PRCM module registers used to configure these clocks, see Section 3.6, *Clock Management Functional Description* in Chapter 3, *Power, Reset, and Clock Management*.

5.4.6.1.2 Clock Gating

- DSP subsystem:

  The DSP internal clocks can be hardware-disabled by the PRCM module when the MSTANDBY/WAIT handshake protocol occurs. To configure the PRCM module so that DSP internal clocks are hardware-supervised, set the corresponding PRCM.CM_AUTOIDLE_xxx bit field to 0x1.

  When the DSP subsystem does not require its internal clocks, they can be disabled at the PRCM module level by setting the corresponding PRCM.CM_FCLKEN_xxx bit field to 0.

  For a complete description of the PRCM module registers, see Chapter 3, *Power, Reset, and Clock Management*.
- SYSC module:

  The DSP SYSC module implements automatic clock gating on internal hardware detection of the absence of activity. The transition from clock-gated to clock-nongated state operates with no penalty for cycle latency.

  Automatic clock-gating is enabled by setting the SYSC_SYSCONFIG[0] AUTOIDLE bit to 1 (default value). This feature can be disabled by setting the SYSC_SYSCONFIG[0] AUTOIDLE bit to 0, which makes the clock free-running.
- WUGEN_DSP module:

  The DSP WUGEN module implements automatic clock gating on internal hardware detection of the absence of activity. The transition from clock-gated to clock-nongated state operates with no penalty for cycle latency.

  Automatic clock gating is enabled by setting the WUGEN_SYSCONFIG[0] AUTOIDLE bit to 1 (default value). The clock can be made free-running by setting the WUGEN_SYSCONFIG[0] AUTOIDLE bit to 0.
- TPCC from the DMA_DSP module:

The DMA_DSP (or TPCC) module implements automatic clock gating on internal hardware detection of the absence of activity. The transition from clock-nongated to clock-gated state operates with no penalty for cycle latency.

Automatic clock gating is enabled by default. It can be disabled by setting the TPCC_CLKGDIS[0] CLKGDIS bit to 1. In this case, all TPCC internal clocks are free-running.

NOTE: To save power, it is recommended to not disable TPCC clock gating and to leave the TPCC_CLKGDIS register at its reset value.

5.4.6.2 Reset Management

In addition to hardware reset signals generated by the PRCM module, the DSP subsystem can be reset by software control.

For a complete description of the PRCM module registers, see Section 3.5.4, *Reset Domains*, in Chapter 3, *Power, Reset, and Clock Management*.

NOTE: Software reset can be applied only while the DSP subsystem is in clock-off mode.

5.4.6.3 Power Down and Wakeup Management

- DSP megamodule power-down controller (PDC):

  The DSP megamodule embeds a PDC block that allows power-down management by software. Individual DSP megamodule blocks such as DSP_C0 CPU, PMC, DMC, EMC, and shared cache can be powered off by the PDC.
- This software control is ensured by the SYS_PD_PDCCMD register:
  - By setting the SYS_PD_PDCCMD[16] GEMPD bit to 1, the user enables power-down management during idle mode.
  - By setting the SYS_PD_PDCCMD[1:0] xMCLOG and SYS_PD_PDCCMD[1:0] xMCMEM bit fields (where x = {P, D, U}), the user controls the XMC clock-gating and standby memory modes. For example, DMC is controlled with the SYS_PD_PDCCMD[5:4] DMCLOG and SYS_PD_PDCCMD[7:6] xMCMEM bit fields.
- The programming sequence for transition to clock-off state is:

  Before executing the IDLE instruction, the following sequence must be performed:

  1. Write 1 to the SYS_PD_PDCCMD[16] GEMPD bit (STANDBY state); by default, the values of the SYS_PD_PDCCMD[1:0] xMCLOG and SYS_PD_PDCCMD[1:0] xMCMEM bit fields (where x = {P, D, U}) are 0x1 so that module clock gating is enabled and the standby mode of memories is statically activated after the IDLE instruction executes.
  2. Mask all interrupts not intended to wake up the DSP subsystem.
  3. Program the PRCM module so that the DSP clocks are cut on DSP standby. For more information, see Section 3.1.1.1.2, *Module-Level Clock Management* in Chapter 3, *Power, Reset, and Clock Management*
  4. Read back all the written registers to ensure write completion.
  5. Confirm that no user-initiated cache coherence operations are in progress.
  6. Ensure that the IDLE code sequence is in L1 or L2.

  The user must also ensure that no other instruction is executed parallel to the IDLE instruction.

5.4.7 Error Identification Process

Several mechanisms are available in the DSP subsystem to report errors at different levels.

5.4.7.1 Error Reporting for DSP DMA

The TPTC and TPCC blocks of the DMA_DSP module also contain registers to inform the user of a problem during DSP external DMA communication.

TPCC block

The TPCC provides one error interrupt output, CCERRINT (EVT38; see Table 5-6), which consolidates the following error conditions:

- QDMA missed events (stored in the TPCC_QEMR)
- DMA missed events (stored in the TPCC_EMR)
- Transfer completion code error (stored in the TPCC_CCERR[16] TCCERR bit)
- Queue threshold error events (stored in the TPCC_CCERR[n] QTHRXCDn bit, where n = 0, 1)

When an error is detected, the CCERRINT event is asserted, because error events do not have enables.

NOTE: The CCERRINT event follows the same convention as other TPCC interrupt outputs. When the error interrupt condition transitions from a no-errors-are-set state to at least one error set, the error output (CCERRINT) pulses high for one TPCC clock cycle. If additional errors are latched before the original error is cleared by the user, the TPCC does not generate additional interrupt pulses. Software must poll all bits during execution of the ISR and clear all error conditions so that subsequent error pulses can be generated by the TPCC block.

Error interrupts can be set and/or reevaluated by writes to the TPCC_EEVAL register.

TPTC block

Each TPTC can also detect several error conditions:

- Read status or write status errors in the TPTC_ERRSTAT[0] BUSERR bit
- TR error in the TPTC_ERRSTAT[2] TRERR bit
- MMR address error in the TPTC_ERRSTAT[3] MMRAERR bit

Errors are recorded in the TPTC_ERRSTAT register, regardless of whether they are enabled. They can be cleared from the TPTC_ERRSTAT register only by writing 1 to the corresponding bit of the TPTC_ERRCLR register.

The error details register (TPTC_ERRDET) contains additional information about the first read status error or write status error detected. Future errors are bit-recorded until the TPTC_ERRDET register is cleared.

If read status and write status are returned to the TPTC in the same cycle, the value of the read or write status that has an error (nonzero) is latched in the TPTC_ERRDET register, and the TPTC_ERRSTAT[0] BUSERR bit is set. If both the read and write status are nonzero, the write status is given priority for setting the TPTC_ERRDET register. The TPTC_ERRDET register is cleared by setting the TPTC_ERRCLR[0] BUSERR bit to 1.

If an error is enabled (by the TPTC_ERREN register), the first occurrence of an enabled error generates a pulsed interrupt to the CPU by the TCERRINT event output (TCERRINT0 with EVT39 for TPTG0, and TCERRINT1 with EVT40 for TPTG1, respectively; see Table 5-6). Subsequent errors do not generate a new pulse until all accumulated errors are cleared by the CPU. The CPU clears bits in the TPTC_INTSTAT register by writing 1 to the corresponding bit(s) of the TPTC_INTCLR register.

5.4.7.2 Error Reporting for the L3_MAIN Interconnect

L3_MAIN interconnect out-of-band errors are also reported by the external L3_MAIN interrupt signal. This signal corresponds to the EVT84 event and is directly connected to the DSP_nIRQ[39] DSP_C0 CPU interrupt line. For more information about L3_MAIN interconnect error reporting, see Section 14.2, *L3 Interconnect* in Chapter 14, *Interconnect*.

5.5 DSP Subsystem Register Manual

5.5.1 DSP Subsystem Instance Summary

Table 5-8. DSP Subsystem Instance Summary

Module Name	Physical Address	Size
INTC_DSP	0x0180 0000	64KiB
PDC	0x0181 0000	4KiB
EDM	0x01BC 0000	4KiB
TPCC	0x01C0 0000	64KiB
TPTC0	0x01C1 0000	1KiB
TPTC1	0x01C1 0400	1KiB
SYSC	0x01C2 0000	4KiB
WUGEN_DSP	0x01C2 1000	4KiB
L1_SCACHE	0x01C3 0000	256 bytes
L2_SCACHE	0x01C3 0200	256 bytes
SCACHE_SCTM	0x01C3 0400	512 bytes
SCACHE_MMU_DSP	0x01C3 0800	2KiB

CAUTION

The SCACHE_MMU_DSP registers are limited to 32-bit data access; 16- and 8-bit access are not allowed and can corrupt register content.

5.5.5.2 EDM Register Description

Table 5-95. EDM_IAR_ADD

Address Offset	0x0000 0020		
Physical Address	0x01BC 0020	**Instance**	EDM
Description	Indirect Register Acces		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RBEND	RESERVED									RREND	RESERVED													ADRS							

Bits	Field Name	Description	Type	Reset
31	RBEND	A one results the Breakpoint End(BEND) status. A zero causes no action.	RW	0
30:22	RESERVED	Reserved.	R	0x000
21	RREND	A one resets the RTOSS Int (AINT) End (RREND) status. A zero causes no action	RW	0
20:10	RESERVED	Reserved.	R	0x000
9:0	ADRS	This 10-bit value creates the indirect register address.	RW	0x000

Table 5-132. TPCC_QEMR

Address Offset	0x0000 0310		
Physical Address	0x01C0 0310	**Instance**	TPCC
Description	QDMA Event Missed Register: The QDMA Event Missed register is set if 2 QDMA events are detected without the first event being cleared or if a Null TR is serviced. If any bit in the TPCC_QEMR register is set (and all errors (including TPCC_EMR/TPCC_CCERR) were previously clear), then an error will be signaled with TPCC error interrupt.

Table 5-166. TPCC_ER

Address Offset	0x0000 1000		
Physical Address	0x01C0 1000	**Instance**	TPCC
Description	Event Register: If TPCC_ER[n] En bit is set and the TPCC_EER[n] En bit is also set, then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. TPCC_ER[n] En bit is set when the input event #n transitions from inactive (low) to active (high), regardless of the state of TPCC_EER[n] En bit. TPCC_ER[n] En bit is cleared when the corresponding event is prioritized and serviced. If the TPCC_ER[n] En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the TPCC_EER register is set, then the corresponding bit in the Event Missed Register is set. Event N can be cleared via software by writing a 1 to the TPCC_ECR pseudo-register.

Table 5-178. TPCC_CER

Address Offset	0x0000 1018
Physical Address	0x01C0 1018 **Instance** TPCC
Description	Chained Event Register: If TPCC_CER[n] En bit is set (regardless of state of TPCC_EER[5] En), then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TPCC_CER[n] En bit is set when a chaining completion code is returned from one of the TPTCs via the completion interface, or is generated internally via Early Completion path. TPCC_CER[n] En bit is cleared when the corresponding event is prioritized and serviced. If the TPCC_CER[n] En bit is already set and the corresponding chaining completion code is returned from the TPCC_TC, then the corresponding bit in the Event Missed Register is set. TPCC_CER[n] En cannot be set or cleared via software.

Table 5-182. TPCC_EER

Address Offset	0x0000 1020		
Physical Address	0x01C0 1020	**Instance**	TPCC
Description	Event Enable Register: Enables DMA transfers for TPCC_ER[n] En pending events. TPCC_ER[n] En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (TPCC_CER) or Event Set Register (TPCC_ESR). Note that if a bit is set in TPCC_ER[n] En while TPCC_EER[n] En is disabled, no action is taken. If TPCC_EER[n] En is enabled at a later point (and TPCC_ER[n] En has not been cleared via software) then the event will be recognized as a valid 'TR Sync' TPCC_EER[n] En is not directly writeable. Events can be enabled via writes to TPCC_EESR and can be disabled via writes to TPCC_EECR register. TPCC_EER[n] En = 0: TPCC_ER[n] En is not enabled to trigger DMA transfers. TPCC_EER[n] En = 1: TPCC_ER[n] En is enabled to trigger DMA transfers.

Table 5-224. TPCC_QER

Address Offset	0x0000 1080		
Physical Address	0x01C0 1080	**Instance**	TPCC
Description	QDMA Event Register: If TPCC_QER[n] En bit is set, then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TPCC_QER[n] En bit is set when a vbus write byte matches the address defined in the TPCC_QCHMAPN_j register. TPCC_QER[n] En bit is cleared when the corresponding event is prioritized and serviced. TPCC_QER[n] En is also cleared when user writes a 1 to the TPCC_QSECR[n] En bit. If the TPCC_QER[n] En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and TPCC_QEER register is set, then the corresponding bit in the QDMA Event Missed Register is set.

Table 5-248. TPCC_CER_RN_k

Address Offset	0x0000 2018 + (0x200 * k)		
Physical Address	0x01C0 2018 + (0x200 * k)	**Instance**	TPCC
Description	Chained Event Register: If TPCC_CER[n] En bit is set (regardless of state of TPCC_EER[n] En), then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TPCC_CER[n] En bit is set when a chaining completion code is returned from one of the TPTCs via the completion interface, or is generated internally via Early Completion path. TPCC_CER[n] En bit is cleared when the corresponding event is prioritized and serviced. If the TPCC_CER[n] En bit is already set and the corresponding chaining completion code is returned from the TC, then the corresponding bit in the Event Missed Register is set. TPCC_CER[n] En cannot be set or cleared via software.

Table 5-251. Register Call Summary for Register TPCC_CERH_RN_k

DSP Subsystem Register Manual

- TPCC Register Summary: [0]

Table 5-252. TPCC_EER_RN_k

Address Offset	0x0000 2020 + (0x200 * k)		
Physical Address	0x01C0 2020 + (0x200 * k)	**Instance**	TPCC
Description	Event Enable Register: Enables DMA transfers for TPCC_ER[n] En pending events. TPCC_ER[n] En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (TPCC_CER) or Event Set Register (TPCC_ESR). Note that if a bit is set in TPCC_ER[n] En while TPCC_EER[n] En is disabled, no action is taken. If TPCC_EER[n] En is enabled at a later point (and TPCC_ER[n] En has not been cleared via software) then the event will be recognized as a valid 'TR Sync' TPCC_EER[n] En is not directly writeable. Events can be enabled via writes to TPCC_EESR and can be disabled via writes to TPCC_EECR register. TPCC_EER[n] En = 0: TPCC_ER[n] En is not enabled to trigger DMA transfers. TPCC_EER[n] En = 1: TPCC_ER[n] En is enabled to trigger DMA transfers.

Address Offset	0x0000 4008 + (0x20 * m)		
Physical Address	0x01C0 4008 + (0x20 * m)	**Instance**	TPCC
Description	A and B byte count		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BCNT																ACNT															

Bits	Field Name	Description	Type	Reset
31:16	BCNT	Count for 2nd Dimension: BCNT is a 16-bit unsigned value that specifies the number of arrays of length ACNT. For normal operation, valid values for BCNT can be anywhere between 1 and 65535. Therefore, the maximum number of arrays in a frame is 65535 (64K-1 arrays). BCNT=1 means 1 array in the frame, and BCNT=0 means 0 arrays in the frame. In normal mode, a BCNT of 0 is considered as either a Null or Dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set, then the programmed BCNT value will be incremented by 1 before submission to TC. that is, 0 means 1, 1 means 2, 2 means 3, ..., 0xFFFE means 0xFFFF. A value of 0xFFFF is an illegal value that will be treated as a Null TR.	RW	0x----
15:0	ACNT	number of bytes in 1st dimension: ACNT represents the number of bytes within the first dimension of a transfer. ACNT is a 16-bit unsigned value with valid values between 0 and 65535. Therefore, the maximum number of bytes in an array is 65535 bytes (64K-1 bytes). ACNT must be greater than or equal to 1 for a TR to be submitted to TC. An ACNT of 0 is considered as either a null or dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the ACNT field represents a word count. The CC must internally multiply by 4 to translate the word count to a byte count prior to submission to the TC. The 2 MSBs of the 16-bit ACNT are reserved and should always be written as 'b00 by the user. If user writes a value other than 0, it will still be treated as 0 since the multiply-by-4 operation (to translate between a word count and a byte count) will drop the 2 msbits. For dummy and null transfer definition, the ACNT definition will disregard the 2 msbits. that is, a programmed ACNT value of 0x8000 in WI-mode will be treated as 0 byte transfer, resulting in null or dummy operation dependent on the state of BCNT and CCNT. Description	Link and Reload parameters		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BCNTRLD																LINK															

Bits	Field Name	Description	Type	Reset
31:16	BCNTRLD	BCNT Reload: BCNTRLD is a 16-bit unsigned value used to reload the BCNT field once the last array in the 2nd dimension is transferred. This field is only used for A-Sync'ed transfers. In this case, the CC decrements the BCNT value by one on each TR submission. When BCNT (conceptually) reaches zero, then the CC decrements CCNT and uses the BCNTRLD value to reinitialize the BCNT value. For AB-synchronized transfers, the CC submits the BCNT in the TR and therefore the TC is responsible to keep track of BCNT, not thus BCNTRLD is a don't care field.	RW	0x----
15:0	LINK	Link Address: The CC provides a mechanism to reload the current PaRAM Entry upon its natural termination (that is, after count fields are decremented to 0) with a new PaRAM Entry. This is called 'linking'. The 16-bit parameter LINK specifies the byte address offset in the PaRAM from which the CC loads/reloads the next PaRAM entry in the link. The CC should disregard the value in the upper 2 bits of the LINK field as well as the lower 5-bits of the LINK field. The upper two bits are ignored such that the user can program either the 'literal' byte address of the LINK parameter or the 'PaRAM base-relative' address of the link field. Therefore, if the user uses the literal address with a range from 0x4000 to 0x7FFF, it will be treated as a PaRAM-base-relative value of 0x0000 to 0x3FFF. The lower-5 bits are ignored and treated as 'b00000, thereby guaranteeing that all Link pointers point to a 32-byte aligned PaRAM entry. In the latter case (5-lsbs), behavior is undefined for the user (that is, don't have to test it). In the former case (2 msbs), user should be able to take advantage of this feature (that is, do have to test it). If a Link Update is requested to a PaRAM address that is beyond the actual range of implemented PaRAM, then the Link will be treated as a Null Linkand all 0s plus 0xFFFF will be written to the current entry location. A LINK value of 0xFFFF is referred to as a NULL link which should cause the CC to write 0x0 to all entries of the current PaRAM Entry except for the LINK field which is set to 0xFFFF. The Priv/Privid state is overwritten to 0x0 when linking. MSBs and LSBS should not be masked when comparing against the 0xFFFF value. that is, a value of 0x3FFE is a non-NULL PaRAM link field.	RW	0x----

Table 5-318. TPCC_CIDX_m

Address Offset	0x0000 4018 + (0x20 * m)		
Physical Address	0x01C0 4018 + (0x20 * m)	**Instance**	TPCC
Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DCIDX																SCIDX															

Bits	Field Name	Description	Type	Reset
31:16	DCIDX	Destination Frame Index: DCIDX is a 16-bit signed value (2's complement) used for destination address modification for the 3rd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the current array (pointed to by DST address) to the beginning of the first destination array in the next frame. It applies to both A-sync and AB-sync transfers. Note that when DCIDX is applied, the current array in an A-sync transfer is the last array in the frame, while the current array in a ABsync transfer is the first array in the frame.	RW	0x----
15:0	SCIDX	Source Frame Index: SCIDX is a 16-bit signed value (2's complement) used for source address modification for the 3rd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the current array (pointed to by SRC address) to the beginning of the first source array in the next frame. It applies to both A-sync and AB-sync transfers. Note that when SCIDX is applied, the current array in an A-sync transfer is the last array in the frame, while the current array in a AB-sync transfer is the first array in the frame.	RW	0x----

Table 5-320. TPCC_CCNT_m

Address Offset	0x0000 401C + (0x20 * m)		
Physical Address	0x01C0 401C + (0x20 * m)	**Instance**	TPCC
Description	C byte count		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																CCNT															

Bits	Field Name	Description	Type	Reset
31:16	RESERVED	write 0's for future compatibility reads return 0's	RW	0x----
15:0	CCNT	Count for 3rd Dimension: CCNT is a 16-bit unsigned value that specifies the number of frames in a block. Valid values for CCNT can be anywhere between 1 and 65535. Therefore, the maximum number of frames in a block is 65535 (64K-1 frames). CCNT of 1 means 1 frame in the block, and CCNT of 0 means 0 frames in the block. A CCNT value of 0 is considered as either a null or dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. WIMODE has no affect on CCNT operation.	RW	0x----
